Project File No.: 23048

1.	Title: Baseline Estimate of the Volume of Remote Handled Transuranic Waste Stored at the Radioactive Waste Management Complex				
2.	Index Codes: Building/Type WMF 714 SSC ID N/A Site Area RWMC				
3.	NPH Performance Category: _____ or <input checked="" type="checkbox"/> N/A				
4.	EDF Safety Category: _____ or <input checked="" type="checkbox"/> N/A SCC Safety Category: _____ or <input checked="" type="checkbox"/> N/A				
5.	Summary: This engineering design file (EDF) estimates a baseline inventory volume of remote handled transuranic (RH-TRU) waste stored at the Radioactive Waste Management Complex (RWMC). Included in this EDF is RH-TRU waste, "suspect" RH-TRU waste, and remote handled (RH) waste that is managed as RH-TRU waste even though the waste is not TRU. There are four laboratory facilities external to the Idaho National Engineering and Environmental Laboratory, (INEEL) and two facilities within the INEEL that generated RH-TRU waste stored at the RWMC. The external laboratories are: (1) Argonne National Laboratory-East, (2) Argonne National Laboratory-West, (3) Bettis Atomic Power Laboratory, and (4) the Naval Reactor Facility. The internal facilities are the Test Reactor Area and Idaho Nuclear Technology and Engineering Center. A total volume of 129 m ³ of RH-TRU waste has been sent to RWMC for temporary storage from 1976 through 1996. "Suspect" RH-TRU waste is lead lined containers that may or may not be RH. Lead lining is used for safe handling to reduce the contact dose rate. Therefore the unshielded contact dose rate is unknown and the container may or may not meet the definition of RH-TRU. Rocky Flats Environmental Technology Site shipped lead shielded containers during the 1970s and 1980s. The majority of the "suspect" RH-TRU waste is under BNFL control. The estimate of the total volume of "suspect" RH-TRU waste is 303 m ³ . In addition to RH-TRU and "suspect" RH-TRU waste, there is a special category of waste that is contaminated with U-233 and may be remote handled but is not TRU waste, although it is managed as RH-TRU waste. Bettis Atomic Power Laboratory shipped U-233 contaminated waste from 1973 through 1987 to the RWMC. The ultimate disposal facility for this waste is currently unknown. The estimate of the total volume is 52 m ³ for the U-233 contaminated waste managed as RH-TRU.

Baseline Estimate of the Volume of Remote Handled Transuranic Waste Stored at the Radioactive Waste Management Complex

1. INTRODUCTION

The disposition of remote handled transuranic (RH-TRU) waste is currently the responsibility of the Idaho National Engineering and Environmental Laboratory (INEEL) Management and Operating contractor. Per the *State of Idaho Settlement Agreement* of October 1995, the disposition of RH-TRU waste must be completed by the target date of December 31, 2018. This engineering design file (EDF) estimates the baseline inventory volume for remote handled transuranic (RH-TRU) waste, the “suspect” RH-TRU waste, and the special category of waste that is remote handled (RH) waste managed as RH-TRU even though the waste is not TRU. This last category of waste is being placed in this EDF for completeness because the Department of Energy (DOE) is required to dispose of this legacy waste and the most likely disposal site to date is WIPP.

TRU waste contains more than 100 nCi per gram of waste of alpha-emitting TRU isotope(s) with a half-life greater than 20 years [1]. RH TRU waste is transuranic waste that has a measured radiation dose rate at the container surface of greater than 200 mR/hr that is not (1) high-level radioactive waste, (2) waste that has been determined to not need the degree of isolation required by disposal regulations, or (3) waste the Nuclear Regulatory Commission has approved for disposal on a case-by-case basis in accordance with 10 CFR Part 61 [2].

The effort to ship TRU waste to WIPP is being driven by the Idaho Settlement Agreement that was entered into in 1995 with the State of Idaho, the Department of Energy, and the United States Navy. This multifaceted legal document requires DOE to remove all forms of radioactive waste from the INEEL. One aspect of that agreement is to remove 65,000 m³ TRU waste prior to December 31, 2018 [3]. RH-TRU waste falls into this category.

Several reference sources have been reviewed and correlated to identify the current volume of inventory in storage at the RWMC. To update the baseline inventory volume, information was cross referenced from the Transuranic Reporting Inventory & Processing System (TRIPS), the Transuranic Contaminated Waste Container Information System (TCWCIS), the Radioactive Waste Management Information System (RWMIS), WASTE, characterization and shipment records, the Intermediate-Level Transuranic Storage Facility (ILTSF) vault records, and several internal documents published concerning the waste inventory at RWMC.

2. BACKGROUND

The RWMC was established in 1952 as a controlled area for the burial of solid radioactive wastes generated by INEEL operations [4]. The RWMC consists of two main waste storage and disposal areas: the Subsurface Disposal Area and the Transuranic Storage Area (TSA). The TSA was established in 1970 for retrievable storage of contact-handled TRU contaminated waste. In November 1976, the ILTSF was established for retrievable storage of RH-TRU waste.

TRU waste containers at the RWMC are generally known to contain laboratory trash, rags, paper, and sources for grouted forms of plutonium or americium process residue materials. There are three

categories of waste stored at the RWMC that this EDF addresses: 1) RH-TRU waste, 2) "suspect" RH-TRU waste, and 3) RH waste managed as RH-TRU waste.

2.1 Remote Handled Transuranic Waste Generators

There are four laboratory facilities external to the INEEL and two facilities within the INEEL that generated RH-TRU waste. The external laboratory facilities are: 1) Argonne National Laboratory East (ANL-E), 2) Argonne-National Laboratory-West (ANL-W), 3) Bettis Atomic Power Laboratory (BAPL), and 4) the Naval Reactor Facility (NRF). The internal facility generators are the Test Reactor Area (TRA) and the Idaho Nuclear Technology and Engineering Center (INTEC). A total of 705 RH TRU waste containers were sent to RWMC for temporary storage from 1976 through 1996.

2.1.1 Argonne National Laboratory-East

Argonne National Laboratory-East generated RH-TRU waste as a result of the destructive examination of experimental fuel and associated materials at the Alpha Gamma Hot Cell Facility between 1976 and 1995 [5, 6, 7, 8, 9, 10, 11, 12, 13]. The waste was shipped in 30-gal drums and bins [14, 15]. A brief summary of the waste is presented.

The experimental fuel belonged to various DOE reactor programs. The fuel was irradiated mostly in the Experimental Breeder Reactor-II at ANL-W. However, it could have been irradiated in various other fast or light water reactors in the DOE complex. Upon irradiation, the fuel, targets and reactor structural materials were sent to the ANL-E for destructive and nondestructive examination. Examination of these materials occurred from 1976 through 1995. Upon completion of the examination, the waste (not fuel) was packaged for shipment to INEEL for temporary storage. The waste was primarily stored in the underground vaults at ILTSF [16].

2.1.1.1 30 Gal Drum Inventory

Six hundred and seventeen (617) 30-gal drums were sent to the INEEL from 1976 through 1995. The contents of the waste drums consisted of item description code (IDC) 104 and 107, which were generated at the Alpha Gamma Hot Cell Facility. The waste was generally packaged into two 7.5-gal pails that were placed in a 30-gal drum [17]. A typical ANL-E waste drum is a 30-gal drum, containing a high-density polyethylene liner, a fiber drum pouch spreader, two polyvinyl chloride (PVC) bags, a polyethylene disc, and two 7.5-gal pails. Figure 1 illustrates the RH-TRU ANL-E waste configuration. The contact dose rates at the time of shipment ranged from 200 mR/hr to 30 R/hr at contact.

2.1.1.2 Bin Inventory

Argonne National Laboratory-East inventory also includes 13 bins as part of the RH-TRU inventory [14, 15]. There are 7 IDC 100 bins and 6 IDC 104 bins that have been identified as being stored at the RWMC.

The general plant waste, IDC 100, consists of a mixture of combustible and noncombustible waste such as paper, rags, plastic bottles, hand tools, and metal cans. Reference 14 lists 7 bins that were shipped to the INEEL; each bin is identified by name, shipment number, and contact dose rate. The bins are MIII bin-steel, generated prior to 1981. The waste was packaged in a 5-gal paint cans or in a 17H 55-gal drum. The 5-gal paint can was placed directly in the bin or inside of a 55-gal drum. The inside of the drum or paint can with the waste may be double contained in plastic; contained in a 4-in. diameter by 8-in. high aluminum can; or contained in ½-gal or 1-gal metal cans or contained in polyethylene bottles. The waste

was placed loosely in the bin or placed in a ½-size or full-size plywood boxes then placed in the bin [14].

The Alpha Gamma Hot Cell Facility combustible waste, IDC 104, is discussed in Section 2.1.1.1 of this document. Reference 15 identifies 6 bins that were sent to the INEEL in 1982 from ANL-E. All waste generated as IDC 104 is considered RH-TRU waste, therefore the bins are part of the RH-TRU inventory. The bins are assumed to be MIII bin-steel generated prior to 1981.

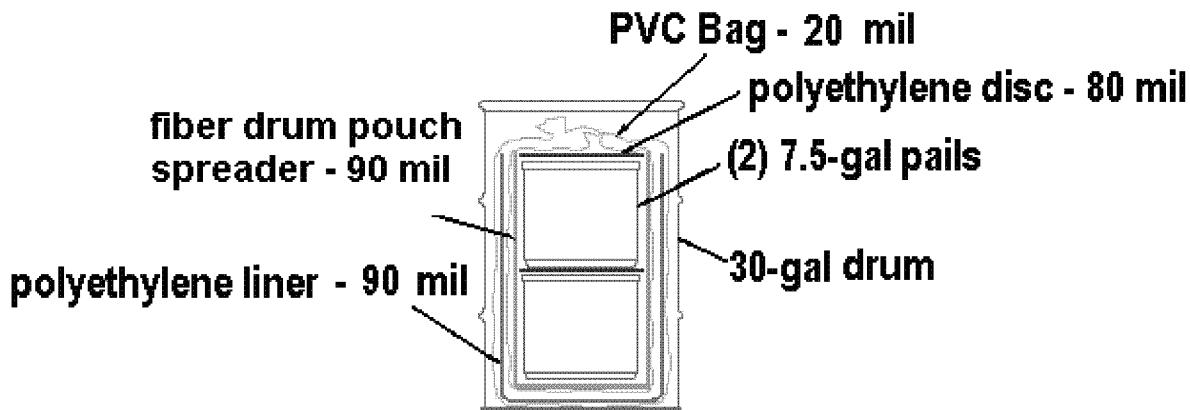

Figure 1. Argonne National Laboratory-East remote handled transuranic waste configuration.

2.1.2 Argonne National Laboratory-West

Argonne National Laboratory-West generated 32 waste containers of RH-TRU waste from 1978 through 1988. The waste was sent in inserts with the exception of four 55-gal drums [18].

The waste was generated from the destructive examination of fuel in the Hot Fuel Examination Facility, buildings ANL-765 and ANL-785. The fuel was irradiated in the Experimental Breeder Reactor-II. The waste is IDC 150, 152, 153, and 160 [19, 18]. Laboratory wastes, IDC 150, consists of both combustible and noncombustible laboratory waste. Plutonium neutron sources, IDC 152, consist of operating equipment from the hot cells, combustible material, and metals. Laboratory waste-combustible, IDC 153, consists of operating equipment from hot cells, combustible material, and metal. Analytical Chemistry and metallographic combustibles is IDC 160. These waste containers are currently stored in the underground vaults at the ILTSF. An ANL-W insert consists of two concentric cylindrical canisters. The waste is placed in a canister, which is placed inside another canister. The canisters are approximately 1-ft. in diameter by 6-ft. in length. An insert configuration is shown in Figure 2. An insert weighs approximately 450 lb.

Reference 18 indicates that IDCs 150, 152, and 153 wastes were shipped as inserts from ANL-W to the RWMC for temporary storage. However, a query of TRIPS and a review of the shipment forms indicate there is one insert with IDC 160 that was sent to RWMC from ANL-W. The insert is ANL-88130.

In 1988 ANL-W shipped 4 RH-TRU 55-gal drums to RWMC for storage. The waste is IDC 161 and is comprised of glassware, paper, polyethylene, and miscellaneous laboratory waste. This waste is currently stored in the underground vaults at ILTSF [16].

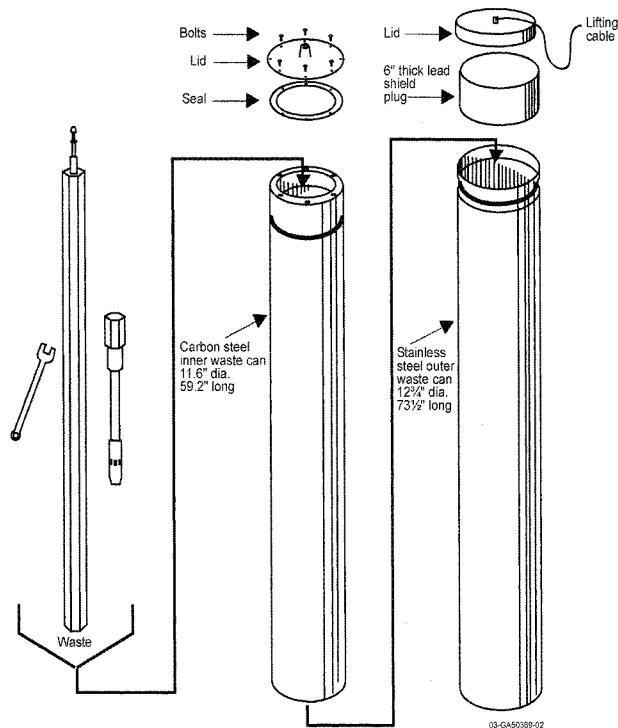

Figure 2. Argonne National Laboratory-West insert configuration.

2.1.3 Bettis Atomic Power Laboratory

In 1988 BAPL via ANL-W sent 2 inserts to RWMC for temporary storage [19]. This waste is IDC 030, solidified grinding sludge, etc. This waste was generated in the L-Building Fuel Manufacturing Facility. It consists of abrasive materials from grinding wheels, includes dust, aluminum oxide and carborundum and rubber and was packaged either as a powder or cake [15]. These waste containers are currently stored in the underground vaults at ILTSF. The waste configuration is shown in Figure 2.

2.1.4 Naval Reactor Facility

From 1977 through 1981 NRF sent RH-TRU waste to the RWMC for temporary disposal. These 27 waste containers are 30-gal drums stored in the underground storage vaults at ILTSF. NRF sent IDC 153, "laboratory wastes-combustible," generated from Building 618 of the Expended Core Facility. The waste includes process equipment, containers, and combustible materials [14].

The waste configuration consists of two 6-gal pails/canisters that are heat-sealed in a 20-mil PVC bag. The heat-sealed bag is then placed in a 100-mil PVC drum liner, which is placed in a 20-mil PVC bag. The outside PVC bag is sealed and placed in a 30-gal drum. The waste configuration is shown in Figure 3.

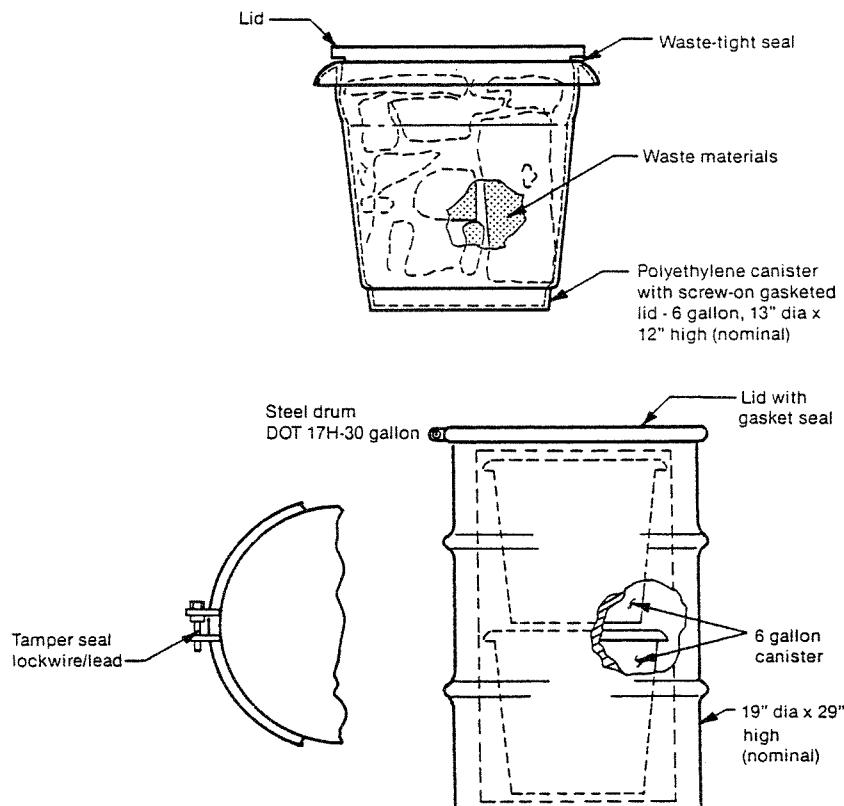

Figure 3. Naval Reactor Facility remote handled transuranic waste configuration.

2.1.5 Test Reactor Area

There were 3 shipments of TRA RH-TRU waste to the RWMC from 1990 through 1996, for a total of 25 waste containers. The waste was shipped in 55-gal drums. In 1990, 10 drums of waste from the drains of TRA Hot Cells and the Alpha Wing Laboratories were sent for disposal [20]. In 1994, 14 drums of RH-TRU waste were sent from the Advanced Test Reactor at TRA to the RWMC. The waste was resin from the mixed bed ion exchange columns at TRA 605 [21]. The last shipment, a 55-drum, occurred in 1996. This waste is currently stored in the underground storage vaults at ILTSF [16].

2.1.6 Idaho Nuclear Technology and Engineering Center

One shipment of two-30-gal drums RH-TRU waste was sent to RWMC for temporary disposal in 1978. The waste is IDC 151, Solidified Fuel Sludge. The waste is stored at ILTSF in the underground storage vaults at ILTSF [16]. The waste was sent from INTEC Building 627 [18].

The waste was generated from the analysis of fuel irradiated at the commercial power reactor H.B. Robinson. An acid base solution was used to dissolve approximately one-half of the fuel rod. The waste consists of glass, plastics, and metal, miscellaneous laboratory equipment, and diatomaceous earth. The bottled wastes are in a sealed can(s), which was (were) placed in plastic bag. The bag was then placed in a lead-lined 30-gal drum [14].

2.2 “Suspect” Remote Handled Transuranic Waste

A special category of waste stored at RWMC is labeled as “suspect” RH-TRU waste. This is TRU waste that may or may not be RH because of lead shielding inside the container. Rocky Flats Environmental Technology Site (RFETS) is assumed to be the only generator of “suspect” RH-TRU waste. “Suspect” RH-TRU waste was shipped during the 1970s and 1980s to the INEEL for temporary storage. The majority of the “suspect” RH-TRU waste is under BNFL control [22].

Reference 22 estimates the number of the “suspect” RH-TRU waste containers at 803 for a total volume of 219.5 m³. This estimate is based both on observation and extrapolation of data events. The IDCs vary from solidified sludge to borated glass. Inside the drum there may be a shield of lead tape, a lead liner, or a lead “pig.” Because the lead shielding in the drum does not allow a measurement of an unshielded contact dose rate of the unopened container, the waste is considered “suspect”.

2.3 Remote Handled Waste Managed as Remote Handled Transuranic Waste

The information in this section is being provided for completeness of this EDF. Bettis Atomic Power Laboratory shipped 1,973 containers of U-233 contaminated waste for temporary storage at INEEL from 1973 through 1987 [22]. This waste was produced during the fabrication of U-233 based fuel and consists of un-irradiated fuel rods, powder, pellets, and fabrication scrap. Approximately 65 of the waste containers are stored in RCRA compliant storage modules. The remaining waste containers are under BNFL control. The waste is in either shielded or unshielded containers.

Of the BAPL RH waste managed as RH-TRU, 172 waste containers contain fuel rods, powder, and pellets (IDC 40). These containers may have lead shielding to reduce radiation exposure. The remaining waste containers are fabrication scrap and contain varying quantities of U-233. The primary source of radiation dose from these wastes is Tl-208 (a daughter product of U-232); U-232 is present as an impurity in the U-233.

3. REMOTE HANDLED TRANSURANIC WASTE INVENTORY

There are four laboratory facilities external to the INEEL that are identified as sending RH-TRU waste to the RWMC for temporary disposal, those generators are: ANL-E, ANL-W, BAPL, and NRF. Internal facilities at the INEEL that sent RH-TRU waste to RWMC for temporary disposal are TRA and INTEC. This section identifies the number of RH-TRU waste containers and the volume. Additional information such as the storage locations, contact dose rates at the time of disposition at RWMC, and additional miscellaneous information can be found in the appendices. The total volume RH-TRU waste, 129 m³, by generator is shown in Table 1.

Table 1. The volume of remote handled transuranic waste.

Generator	Number of Containers	Total Volume (m ³)
ANL-E	630	115.3
ANL-W	32	4.8
BAPL	2	0.3
NRF	27	3.1
TRA	25	5.2
INTEC	2	0.2
Total	718	129

3.1 Argonne National Laboratory-East

The amount of RH-TRU waste sent to INEEL is six hundred and seventeen (617) 30-gal drums. Additionally, there are 13 bins that have been identified as RH-TRU either by the IDC associated with the bin [15] or by the contact radiation dose rate of the bin [14]. The total volume of ANL-E RH-TRU waste is 115.3 m³ and is shown in Table 2. A summary of the method to determine the volume of the waste is given in this section.

Table 2. The volume of Argonne National Laboratory-East remote handled transuranic waste.

Container Type	Number of Containers	Volume/Container (m ³)	Total Volume (m ³)
30-Gal Drum	617	0.114	70.4
Bin	13	3.45	44.9
Total	630		115.3

3.1.1 30-Gal Drum Inventory

There are 617 30-gal drums of ANL-E RH-TRU waste that are either IDC 104 or IDC 107. The 30-gal drum inventory listed in Appendix A, Table A-1 is based on a review and correlation of the following pieces of information/documentation:

- RH-TRU characterization and shipping records for ANL-E [5, 6, 7, 8, 9, 10, 11, 12, 13].
- TRIPS WART^a 97, “ILTSF Inventory” [23].
- TRIPS WART 107, “WASTE Query for ILTSF Location” [24].

^a WART is waste analysis report tracking.

- RWMIS ILTSF Inventory [25].
- ILTSF vault logs in the RH-TRU to WIPP Project files [16].
- *AK Documentation Report for INEEL-Stored Remote Handled Transuranic Waste from Argonne National Laboratory-East* [17].
- *Waste Characterization for INEL Remote Handled / Special-Case Stored Transuranic Waste* [14].
- *Crosswalk for the Remote Handled Transuranic Waste Inventory* [26].

The characterization and shipping records contain various pieces of information such as:

- A packaging and survey form generated at the Alpha Gamma Hot Cell Facility at ANL-E, denoted as “pack sheet” in this report.
- “Radioactive Waste Form”, Form ID-135.
- “Transuranic Waste Container Form”, Form ID-137.
- Waste stream profile forms, denoted as WSP in this report.
- “Stored, Disposed, or Processed Solid Radioactive Waste Form”, ID F 5820.2.
- “Transuranic Waste Data Base Input Form”, ID F 5820.2A.
- “US DOE Off-Site Radioactive Material Shipment Record”, Form DOE 5480.1A.
- “Transuranic Waste Package Data”, denoted as TWPD in this report.
- Additional miscellaneous information/forms.

Appendix A, Table A-1 identifies the major forms associated with each waste container as well as the storage location, the contact dose rate at the time of disposition, the disposition date, the shipment number, the original waste container (if it was repackaged). The waste container is identified in Appendix A, Table A-1 by the waste container identification (ID) associated with the waste container from Reference 17. Crosswalk information for the waste container IDs is found in Reference 26.

Drum number 786 was previously identified in INEEL’s inventory and is listed in Reference 17. This drum was placed on the inventory based on information collected at ANL-E. However, based on the fact that no reference is found in TRIPS, RWMIS, or the ILTSF vault records this drum was removed from the inventory. There is no indication it was ever shipped to INEEL. The inventory in storage as correlated between TRIPS, RWMIS, the ILTSF vault logs, the characterization and shipping records, and the acceptable knowledge document for ANL-E is 617 30-gal drums. The volume of the 30-gal drum inventory is 70.4 m³.

3.1.2 Bin Inventory

There are 13 bins of ANL-E RH-TRU waste that are IDC 100 or IDC 104. The bin inventory listed in Appendix A, Table A-2 is based on a review and correlation of the following pieces of information/documentation:

- *Waste Characterization for INEL Remote Handled / Special-Case Stored Transuranic Waste* [14].
- *Waste Generator Questionnaire* [15].
- TRIPS WART 106, “RH IDC 100 Waste Container Bin Query” [27].
- TRIPS WART 98, “Information on Bins” [28].
- TRIPS WART 108, “WASTE Query for Bins IDC 104” [29].
- RWMIS TSA Inventory [30].
- *Crosswalk for the Remote Handled Transuranic Waste Inventory* [26].

The 13 bins that have been identified as RH-TRU are IDC 100 and IDC 104. These waste containers are listed in Appendix A, Table A-2. The bins are listed in Appendix A, Table A-2 according to the waste container ID found in TRIPS. Crosswalk information for the waste container IDs is found in Reference 26.

Reference 14 identifies seven bins by waste container ID and the shipment number associated with each bin. Also included is the contact dose rate of each bin prior to it being sent to INEEL for disposal. Based on this information, TRIPS identified each bin and indicated that the bin was in inventory [27]. However, a location for these bins was not identified (this is not uncommon for waste containers that were received during this time period). Because TRIPS verified the waste container and the contact dose rate information presented in Reference 14, these bins were added to the inventory. The bins are listed in Appendix A, Table A-2 according to the waste container ID in TRIPS. The bins are MIII bin-steel, generated prior to 1981. The volume of a bin is 3.45 m³.

The Alpha Gamma Hot Cell Facility combustible waste, IDC 104, is discussed in Section 2.1.1 of this document. Reference 15 identifies 6 bins that were sent to the INEEL in 1982 from ANL-E. All waste generated as IDC 104 is considered RH-TRU waste. Therefore, the bins are part of the RH-TRU inventory. A TRIPS query identified 6 bins as IDC 104 that were packaged in late 1981 [28], and identified the originator as ANL-E. The WASTE database was then queried on a container-by-container basis and the shipment number was identified [29]. With the shipment information, RWMIS was then queried to identify a storage location [30]. RWMIS identified the bins based on the shipment number. These databases were queried to confirm the presence of these waste containers. The bins were sent as shipment number 22313 and were dispositioned at RWMC on 7/16/82 at TSA-RC2SN+4M. Based on the fact that all 3 databases identified the bins and that Reference 15 indicates that ANL-E sent the waste containers, these bins are added to the inventory and are identified in Appendix A, Table A-2 of this EDF. The waste container ID in TRIPS identifies each bin.

Assuming that IDC 100 and IDC 104 bins are similar waste containers, the total volume of the 13 RH-TRU ANL-E bins is 44.9 m³.

3.2 Argonne National Laboratory-West

The ANL-W RH-TRU inventory listed in Appendix B, Table B-1 is based on a review and correlation of the following pieces of information/documentation:

- RH-TRU characterization and shipping records for ANL-W [18].
- TRIPS WART 97, “ILTSF Inventory” [23]
- TRIPS WART 107, “WASTE Query for ILTSF Location” [24].
- RWMIS ILTSF Inventory [25].
- ILTSF vault logs in the RH-TRU to WIPP Project files [16].
- *ANL-W Radioactive Inserts Stored at ILTSF* [19].
- *Waste Characterization for INEL Remote Handled / Special-Case Stored Transuranic Waste* [14].
- *Crosswalk for the Remote Handled Transuranic Waste Inventory* [26].

The inventory consists of 28 inserts and four-55-gal drums. The total volume of ANL-W waste is 4.8 m³ and its breakdown is shown in Table 3. Information about the ANL-W RH-TRU waste is in Appendix B, Table B-1. The waste container IDs listed in Appendix B, Table B-1 are primarily from the shipment forms. Crosswalk information for the waste container IDs is found in Reference 26.

Table 3. The volume of Argonne National Laboratory-West remote handled transuranic waste.

Container Type	Number of Containers	Volume/Container (m ³)	Total Volume (m ³)
Insert	28	0.142 ^a	4.0
55-Gal Drum	4	0.208	0.8
Total	32		4.8

a) Based on the data provided in Reference 14.

3.3 Bettis Atomic Power Laboratory

The BAPL RH-TRU inventory listed in Appendix C, Table C-1 is based on a review and correlation of the following pieces of information/documentation:

- RH-TRU characterization and shipping records for ANL-W [18].
- TRIPS WART 97, “ILTSF Inventory” [23]
- TRIPS WART 107, “WASTE Query for ILTSF Location” [24].
- RWMIS ILTSF Inventory [25].
- ILTSF vault logs in the RH-TRU to WIPP Project files [16].
- *ANL-W Radioactive Inserts Stored at ILTSF* [19].

- *Waste Generator Questionnaire* [15].
- *Crosswalk for the Remote Handled Transuranic Waste Inventory* [26].

The inventory of RH-TRU waste generated by BAPL consists of 2 inserts. The waste was actually shipped by ANL-W to the INEEL. The total volume of BAPL RH-TRU waste is 0.3 m³ as shown in Table 4. Table C-1 in Appendix C contains additional information about the RH-TRU BAPL waste (ANL-88107 and ANL-88164). The waste container IDs listed in Appendix C, Table C-1 are taken from the shipment forms. Crosswalk information for the waste container IDs is found in Reference 26.

Table 4. The volume of Bettis Atomic Power Laboratory remote handled transuranic waste.

Container Type	Number of Containers	Volume/Container (m ³)	Total Volume (m ³)
Insert	2	0.142 ^a	0.3

a) Based on the data provided in Reference 14.

3.4 Naval Reactors Facility

The NRF RH-TRU inventory listed in Appendix D, Table D-1 is based on a review and correlation of the following pieces of information/documentation:

- RH-TRU characterization and shipping records for NRF [18].
- TRIPS WART 97, “ILTSF Inventory” [23]
- TRIPS WART 107, “WASTE Query for ILTSF Location” [24].
- RWMIS ILTSF Inventory [25].
- ILTSF vault logs in the RH-TRU to WIPP Project files [16].
- *Waste Characterization for INEL Remote Handled / Special-Case Stored Transuranic Waste* [14].
- *Crosswalk for the Remote Handled Transuranic Waste Inventory* [26].

The twenty-seven 30-gal drums identified as NRF RH-TRU waste are listed in Appendix D, Table D-1. The waste container IDs listed in Appendix D, Table D-1 are primarily from the shipment forms. Crosswalk information for the waste container IDs is found in Reference 26. The volume of NRF RH-TRU waste is 3.1 m³ as shown in Table 5.

Table 5. The volume of Naval Reactor Facility remote handled transuranic waste.

Container Type	Number of Containers	Volume/Container (m ³)	Total Volume (m ³)
30-Gal Drum	27	0.114	3.1

3.5 Test Reactor Area

The TRA RH-TRU inventory listed in Appendix E, Table E-1 is based on a review and correlation of the following pieces of information/documentation:

- RH-TRU characterization and shipping records for TRA [18].
- TRIPS WART 97, “ILTSF Inventory” [23]
- TRIPS WART 107, “WASTE Query for ILTSF Location” [24].
- RWMIS ILTSF Inventory [25].
- ILTSF vault logs in the RH-TRU to WIPP Project files [16].
- Interoffice correspondence from D. R. Wilkenson [20].
- Interoffice correspondence from D. R. Wilkenson [21].
- *Crosswalk for the Remote Handled Transuranic Waste Inventory* [26].

The twenty-five 55-gal drums identified as TRA RH-TRU waste is documented in Appendix E, Table E-1. The waste container IDs listed in Appendix E, Table E-1 are primarily from the characterization and shipping records. Crosswalk information for the waste container IDs is found in Reference 26. The volume of TRA RH-TRU waste is 5.2 m³ as shown in Table 6.

Table 6. The volume of Test Reactor Area remote handled transuranic waste.

Container Type	Number of Containers	Volume/Container (m ³)	Total Volume (m ³)
55-Gal Drum	25	0.208	5.2

3.6 Idaho Nuclear Technology and Engineering Center

The INTEC RH-TRU inventory listed in Appendix F, Table F-1 is based on a review and correlation of the following pieces of information/documentation:

- RH-TRU characterization and shipping records for INTEC [18].
- TRIPS WART 97, “ILTSF Inventory” [23]
- TRIPS WART 107, “WASTE Query for ILTSF Location” [24].
- RWMIS ILTSF Inventory [25].
- ILTSF vault logs in the RH-TRU to WIPP Project files [16].

- *Waste Characterization for INEL Remote Handled / Special-Case Stored Transuranic Waste* [14].
- *Crosswalk for the Remote Handled Transuranic Waste Inventory* [26].

The two-30-gal drums of INTEC RH-TRU waste is documented in Appendix F, Table F-1. The volume of INTEC RH-TRU waste is 0.2 m³ as shown in Table 7. The waste container IDs listed in Appendix F, Table F-1 are taken from the ILTSF vault logs. Crosswalk information for the waste container IDs is found in Reference 26.

Table 7. The volume of Idaho Nuclear Technology and Engineering Center remote handled transuranic waste.

Container Type	Number of Containers	Volume/Container (m ³)	Total Volume (m ³)
30-Gal Drum	2	0.114	0.2

4. “SUSPECT” REMOTE HANDLED TRANSURANIC WASTE INVENTORY

Rocky Flats Environmental Technology Site is assumed to be the only generator of “suspect” RH-TRU waste. The volume of the RFETS “suspect” RH-TRU waste is 303 m³, this estimate is based on observation for the fall of 1971 – 1990 [14, 31] and extrapolation for 1970 – 1971 (October 31). This value is based on a review of the following references:

- TRIPS WART 101, “Lead-lined Waste + rerun AK RTR” [31].
- TRIPS WART 109, “Rerun of AK RTR Data for RH suspect inv” [32].
- *Waste Characterization for INEL Remote Handled / Special-Case Stored Transuranic Waste* [14].
- *Baseline Estimate of the Amount of Suspect Remote Handled Transuranic Waste (RH-TRU) Stored at the Radioactive Waste Management Complex (RWMC)* [22].
- TRIPS WART 110, “IDC counts based on pack dates for RH inv” [33].
- *Inventory Analysis of Stored Transuranic (TRU) Waste at the Radioactive Waste Management Complex (RWMC)* [34].
- *Initial Drum Retrieval Final Report* [35].
- *Early Waste Retrieval Final Report* [36].

4.1 Database History

The Transuranic Contaminated Waste Container Information System (TCWCIS) was used from 1971 until 1984. The Transuranic Waste Information System (TWMIS) replaced TCWCIS in 1984.

TRIPS replaced TWMIS in 1998. Data that were not approved and verified through Reference 37 were not migrated to TRIPS. Multiple waste container entries for a single event were also not migrated to TRIPS. Additional information migrated to the WASTE database were pieces of information and tables from TWMIS and the Data Management System (DMS). The DMS database was the database that was in use at Stored Waste Experimental Pilot Plant prior to the implementation of TRIPS, therefore real-time radiography data events were entered in this database. Since DMS is no longer an accessible database, WASTE, which contains various DMS tables was queried for “suspect” containers.

The TCWCIS had a shield code of “-1” when lead was identified in a waste container. The databases that followed did not have the shield code, “-1”. When real-time radiography was performed and lead was observed in a drum during the 3100 m³ Project, a lead field was marked in TRIPS. The lead designation in TRIPS was used to identify drums that contained lead. WASTE was also queried to identify lead containing drums. Based on the IDC, a determination was made as to whether lead was used as shielding in the drum. The data results were compared to those found in Reference 14, which contained a listing from TCWCIS.

4.2 Data

Reference 14 identified 453 records that contained lead referenced by the shield code in TCWCIS. Also included in this count were 6 fiber reinforced plywood (FRP) boxes, which shall be retained here for simplicity. These waste containers were identified from direct observation and were in inventory from 1971 through 1984. The databases, TRIPS and WASTE, identified several additional waste containers with lead. TRIPS identified 1,326 containers with lead while WASTE identified 561 containers with lead. Table 8 summarizes the unique waste container count that was identified in the database queries. In an effort to be conservative, any event that indicated lead being present in a container was enough to have the container included in Table 8.

Table 8. Rocky Flats Environmental Technology Site lead containing drums identified by database queries.

Database	Lead Containing Records	Explanation	Reference
TRIPS	1,326	Records identified in TRIPS as containing lead and real-time radiography after 1/1/98.	Reference 32
WASTE	129	129 of the 561 records identified in Reference 31 were not identified in Reference 32.	Reference 31
WASTE	80	80 of the 561 waste containers identified Reference 31 with lead are identified in Reference 32 without lead.	Reference 31
	1,535	Total number of containers with suspected lead content.	

Waste containers were eliminated based on the following criteria:

- Waste containers found in Reference 14.
- Leaded apron.
- Leaded tape that was not used as shielding.

- Leaded glass.
- Leaded gloves.
- Lead scrap material.
- Additional waste containers were evaluated based on a case-by-case basis.
- Three waste containers with package dates of 1950.
- Waste containers that are no longer in the inventory.

The number of “suspect” drums that remained from the initial 1,535 was 450 unique containers [32]. When the 453 “suspect” waste containers identified in the Reference 14 are added to the 450 drums identified by TRIPS and WASTE, the total the number of “suspect” waste containers is 903. The “suspect” waste containers were identified from direct observation and were packaged from November 1, 1971 through January 1, 1990. The total number of RFETS drums with pack dates from November 1, 1971 through January 1, 1990 is 82,533 waste containers [33]. The pack date was used instead of the disposition date because a smaller fraction of drums were missing their pack dates. In the event a pack date was not available a disposition date was used. The total percentage of lead shielded RFETS waste containers is 1.1% for November 1, 1971 through January 1, 1990.

The observations of drums in inventory from the fall of 1971 through 1989 were used to estimate the drums received from 1970 through the fall of 1971. Drums stored during 1970 – 1971 were often characterized as unknown and/or placed under earthen cover for temporary disposal. These drums are not identified in any database. The best estimate of the number of containers during this time period is 42,404 [34, 35, 36].

Assuming all waste generation and packaging processes are the same for both 1970 to fall of 1971 and the fall of 1971 through 1990, the same fraction of waste containers will contain lead. Based on the best estimate, there are 42,404 waste containers that are not entered in a waste database. Given that 1.1% of the RFETS containers were found in the RFETS population of drums from 1971 through 1990, the extrapolation of 1.1% yields 466 ($0.011 * 42,404 = 466$) additional lead-lined containers for the period of 1970 to the fall of 1971. As such, there should be a total of $903 + 466 = 1,369$ lead-lined containers for the period 1970 through 1990. Table 9 identifies the total number of “suspect” RH-TRU containers as 1,369; the volume is 303 m^3 . The waste containers identified as “suspect” RH-TRU are identified in Appendix G, Table G-1 along with their respective IDC. The waste containers are identified in Appendix G, Table G-1 by the waste container ID in TRIPS.

Reference 22 estimates the total number of “suspect” waste containers as 803 while this document estimates 1,369 waste containers as being lead-shielded waste containers. The increase in the number of lead-shielded containers is attributed to the fact that Reference 22 did not include the containers identified in TRIPS as containing lead. An additional 450 containers were identified in TRIPS and WASTE as containing lead as observed by direct observation. In addition, the fraction of containers directly observed as containing lead is used to extrapolate the number of containers with lead for 1970 – 1971 (October 31) based on the total number of containers in those years, which is different from the number of containers with lead found in Reference 22. Also by using the containers identified by TRIPS as containing lead, the need to extrapolate containers with pack dates from 1984 – 1990 is eliminated. Thus, a total of 566 additional waste containers are estimated to be lead-shielded waste containers, giving a total of 1,369 “suspect” waste containers.

Table 9. The volume of Rocky Flats Environmental Technology Site “suspect” remote handled transuranic waste.

Time period	Container Type	Number of Containers	Volume per Container (m ³)	Total Volume (m ³)	Comments
1970 – 1971	55-Gal Drum	466	0.208	96.9	Based on extrapolation from 1971 – 1990.
	55-Gal Drum	447	0.208	93.0	
1971 – 1984	FRP Bin	6	3.2	19.2	Based on Reference 14.
1971 – 1990	55-Gal Drum	450	0.208	93.6	Based on Reference 32.
TOTAL		1,369		303	

5. REMOTE HANDLED WASTE MANAGED AS REMOTE HANDLED TRANSURANIC WASTE

The volume of the RH waste managed as RH-TRU waste is 52 m³. This inventory was generated by BAPL. For planning purposes the number of containers managed as RH-TRU was assumed to be 250 containers (52 m³). Documentation indicates 104 m³ total volume. However, approximately 52 m³ of the total is fuel and fuel rods that will not be disposed of at WIPP. This information is included for completeness of this EDF. The following references were reviewed for this waste estimate:

- Interoffice correspondence from J.W. Sterbentz and R.L. Sant [38].
- E-mail correspondence between R.N. Bhatt and D.P. Zeek [39].
- TRIPS WART 111, “Bettis Gen BL Queries for RH Inv” [40].
- *Advanced Mixed Waste Final Environmental Impact Statement* [41].

The BAPL RH waste managed as RH-TRU waste and is contaminated with U-233. A detailed study of the U-233 waste inventory yielded an estimated 436 containers that may reach or exceed a surface dose rate of 200 mR/hr after the year 2002. The analysis was performed using ORIGEN-2 and MicroShield^b. There were two impurity levels of U-232 in the U-233 waste based on information available from BAPL, as well as in certain fuel rods stored at RWMC [38, 39]. The results of the analysis indicated that the number of U-233 waste containers that have the potential to reach or exceed a surface dose of 200 mrem/hr in the next few years (2002-2005) varies from 224 to 647. If an average of the lower and upper range numbers is assumed, the U-233-contaminated waste stream will yield some 436 containers. Out of these, 172 containers are assumed to have lead shielding and can be handled as contact handled waste [22].

^b MicroShield is a product of Grove Engineering.

Table 10. Bettis Atomic Power Laboratory U-233 contaminated waste.

IDC	Description	Number of Containers	Number of Inserts	Number of Other	Volume (m³)
10	Rags, gloves, polyethylene, combustible	940			195.5
12	Miscellaneous sources	1			0.20
15	Neutron sources	4			0.80
20	Noncompressible, noncombustible	794			165.2
30	Solidified grinding sludge and related	45	2 ^a		16.3
40	Solidified binary scrap powder and related	95		77	49
50	Solidified solutions	1			0.20
81	Metal-metal samples fissile	17			3.30
TOTALS		1,897	2	77	430.5

a) Included within the RH-TRU inventory.

Reference 41 identifies the BAPL waste as having 1,896 containers while Table 11 identifies 1,897 containers. The discrepancy comes from an additional drum of IDC 15. This waste container, IDBLM1049, was identified in a query of TRIPS [40]. The waste container IDC and waste generator were unknown until 2001 when real-time radiography was performed on the 55-gal drum. Based on the real-time radiography, the IDC 15 and the waste generator were assigned to the drum. Assuming the same configuration and volume, an additional 0.2 m³ was assigned to this waste stream. The BAPL waste inventory is identified along with the associated IDC in Appendix C, Table C-2. The waste container ID in TRIPS identifies the containers listed in Appendix C, Table C-2.

6. CONCLUSION

There are three waste types presented in this EDF, RH-TRU, "suspect" RH-TRU waste, and RH waste managed as RH-TRU waste. The volume of the waste types is shown in Table 11 as well as the number of containers. Containers except for the project containers are identified in Table 11 and additional container information is listed in the appendices of this EDF except for the lead-shielded containers projected for the "suspect" RH TRU inventory. The determination of waste characteristics was based on queries of multiple databases, reviews of the characterization and shipping reports, the ILTSF vault storage log sheets, and several other documents on waste disposition.

Table 11. Baseline inventory volume of waste.

Waste Type	Number of Containers	Volume (m³)
RH-TRU	718	129
"Suspect" RH-TRU	1,369	303
RH managed as RH-TRU	250	52
TOTAL	2,523	484
