

5. WASTE HAZARDOUS CHARACTERIZATION

The majority of INEL TSA stored waste is mixed waste. The waste is contaminated with both RCRA listed and characteristic constituents as well as some TSCA regulated constituents. Source information used to identify the presence of contaminants was in accordance with the current database and supporting documentation used for Federal Facilities Compliance Act compliance reporting requirements. Information available from compliance reporting contained estimated listings of contaminants present in the waste; however, definitive information on contaminant concentrations present in the waste was not available. Further document review for presence of contaminants resulted in the additional listing of some constituents in a few of the waste streams.

The concentration information is presented in Appendices A and B. Additional compilations and assumptions were made in order to expand and quantify concentration values and present bounding estimates. Confidence in the accuracy of the estimated concentration values given at a content code level based on past documentation is low; however this information is considered the best available at this time.

Assumed maximum concentrations are also shown in Appendices A and B and are considered to represent bounding values for listed constituents with a margin of conservatism. The intent of this presentation is to provide a consistent basis for use in preparation and evaluation of proposals for treatment services. The information provided in this section is based on data contained in the IMWI database^a and work by Raivo and Pace (1994)^b and Raivo (1995).^c

Ongoing characterization efforts being performed at the INEL will increase the confidence in some concentration values presented in future waste descriptions, and any additional information acquired during retrieval efforts prior to any transport of the waste will be made available. Efforts necessary to obtain high confidence data in all the varied waste streams may not be economically feasible, therefore generation of any facility Waste Acceptance Criteria for input waste streams should allow for a sufficient margin of conservatism.

Historical Transuranic Storage Area (TSA)-stored waste hazardous summary information is shown in Table 5-1 for primary hazardous constituents. Table 5-1 concentrations are based on typical expected concentration from historical documents. Table 5-2 provides current estimates of the major contaminants based on assumed maximum concentrations at the content code level rolled up to the total, which are considered to represent conservative estimates. Table 5-3 provides estimates for all contaminants. Tables 5-2 and 5-3 should be used for all estimates; Table 5-1 is provided for reference only.

Table 5-1. Historical TSA-stored waste hazardous information.^a

Hazardous constituent	Average mass fraction of total waste	Maximum fraction of any waste container
1,1,1-trichloroethane	0.00581	0.1500
Carbon tetrachloride	0.00627	0.0500
1,1,2-trichloro-1,2,2-trifluoroethane	0.00371	0.0500
Trichloroethene	0.00392	0.1500
Perchloroethylene	0.00062	0.0500
Methylene chloride	0.00040	0.0010
Methyl alcohol	0.000008	0.000025
Butyl alcohol	0.000003	0.00001
Xylene	0.00002	0.00005
Cadmium	0.000003	0.00001
Lead	0.00826	0.6000
Mercury	0.00354	0.2000
Lithium	0.00177	0.2000
Beryllium	0.00021	0.9500
Nitric acid	0.00190	0.5050
Nitrates	0.00037	0.9000
Polychlorinated biphenyls ^{b,c}	0.00854	0.5560
Asbestos ^b	0.00274	0.4500

a. Historical reporting information on chemical contaminants representative of waste at the TSA. (EDF ENV-003, 2/5/90. INEL ER&WM EIS, 1993, RFP No. DE-RP07-94ID 13278 SOW, 12/15/93)

b. To provide more complete waste information, concentration data for some toxic (TSCA) waste constituents not considered hazardous under RCRA are provided.

c. As many as 7,600 drums stored in the TSA are suspect for containing PCBs. The actual number of drums is unknown. These drums are estimated to be within the code 000 (Unknown) or code 003 (Organic setups) waste streams. For purposes of treatment services feasibility studies, PCB concentration within these 7,600 drums is considered to be >500 ppm.

Table 5-2. Distribution of hazardous contaminants.^a

Hazardous Contaminant ^b	Percent of Total inventory (%)	Percent of Total RCRA contaminants (%)	Estimated Contaminant Mass (kg)
RCRA			
D008A	4.13	17.15	1,317,638.67

Table 5-3. (continued).

Ucode identifier	EPCODE	RCRA category	Subcategory	Estimated mass ^b (kg)
a. Estimated RCRA and TSCA contaminants summary representative of waste currently stored at the TSA.				
b. Based on assumed maximum concentrations of contaminants.				
c. An estimated 7,600 drums stored in the TSA are estimated to contain PCBs. These drums are estimated to be within code 000 (Unknown) or code 003 (Organic Setups) waste streams. For the purposes of treatment services RFP responses, PCB concentration within these 7,600 drums is considered to be > 500 ppm.				

6. INEL WASTE PROFILE SHEET FORMAT

The format and description of the contents of the detailed waste information provided in Appendices A and B for mixed and non-mixed ALLW and TRUW are provided below. Appendix A provides detailed information on the ALLW and Appendix B provides information on the TRUW. The appendices provide a series of detail tables based on similar subject matter (e.g., description, storage, matrix information, etc.), with the format of each table being similar in each appendix.

6.1 Identification and Description

Table 1 provides general identification and description information for each wastestream. The following fields appear in this table:

<i>Waste category</i>	A value of 2 denotes ALLW, a value of 3 denotes TRUW.
<i>Mixed waste</i>	A value of 1 denotes mixed waste, a value of 2 denotes non-mixed waste.
<i>Key code</i>	A unique number code assigned to each waste stream for tracking purposes.
<i>Waste stream identifier code</i>	An INEL text/number code which identifies each waste stream.
<i>Content code</i>	A number or text code for each waste stream which can be related to past identification practices.
<i>Waste stream name</i>	The waste stream name.
<i>Description</i>	A description of the waste stream. This is usually the waste stream description provided in WMIS.
<i>PCBs</i>	An indication whether PCBs may be present in the waste, a value of 1 denotes PCBs are expected to be in the waste, 2 denotes not expected, 3 denotes unknown.
<i>Asbestos</i>	An indication whether asbestos may be present in the waste, a value of 1 denotes asbestos is expected to be in the waste, 2 denotes not expected, 3 denotes unknown.
<i>Rad level</i>	An indication of the expected radiation level of the container. A value of 1 denotes waste is expected to be contact handled, a value of 2 denotes that some portion or all of the waste stream is expected to contain waste which may be remote handled (greater than 200 mrem/hr at contact).
<i>Generator site</i>	The name of the site that generated the waste.
<i>Combustibility</i>	An indication of the combustibility of the waste. A value of 1 denotes combustibility is estimated at greater than 90% (combustible). A value of 2 denotes combustibility is estimated at

between 10-90% (partially combustible). A value of 3 denotes combustibility is estimated at less than 10% (noncombustible)

The fields waste category, mixed waste, key code, waste stream identifier code, and content code fields are common for each subsequent appendix table.

Table 6-1 presents a summary listing of waste stream identifier codes and waste stream names.

Table 6-1. Summary of waste identifier code and name.*

Key	Waste stream ID	Content code	Waste stream name
Alpha Low Level Mixed Waste			
155	ID-AEO-100	100	GENERAL PLANT WASTE
156	ID-AEO-101	101	CUT UP GLOVEBOXES
297	ID-AEO-102	102	ABSORBED LIQUIDS
206	ID-AEO-104	104	ALPHA HOT CELL WASTE
300	ID-ANL-161	161	ANL-W ANALYTICAL CHEMISTRY LAB GLASSWARE

a. IMWI Database, September 1995.

6.2 Storage

Table 2 provides storage information for each wastestream. In addition to the above common fields, the following fields appear in this section:

<i>Container Type</i>	Type of container used for waste storage, i.e., drum, box, bin, insert.
<i>Form</i>	The physical form of the waste. A blank or the letter S denotes a solid waste. The letter L denotes a liquid waste.
<i>Number of containers</i>	Number of container within each container type.
<i>Volume (m³)</i>	The estimated volume of the containers in cubic meters based on typical waste volumes for each container.
<i>Mass (kg)</i>	The estimated gross mass (container mass and mass of the waste).

At the INEL, stored TRU and ALLW wastes are tracked by two database systems: the Radioactive Waste Management Information System (RWMIS) and the Transuranic Waste Database (TWDB). RWMIS is thought to accurately represent the total quantity of waste in storage. However, it is missing content codes for many shipments, making it impossible to assign containers to a waste stream represented at the content code level. TWDB provides content code information for all containers identified in the database, but is missing a large percentage (~20%) of the total waste. Various studies have attempted to resolve the discrepancies between these two databases. For this report, the IMWI database, which reflects FFCA reporting information and resolves discrepancies between the RWMIS and TWDB, was used as the basis for

inventory information. This database reports inventory values by typical container type. The following typical container volumes (external) were used in estimates of gross waste volume:

Drum	0.212 m ³
Box	3.17 m ³
Bin	3.50 m ³
Insert	0.212 m ³

The IMWI cites a previous study which used TWDB and RWMIS reports to resolve known discrepancies, and found that the two databases are in good agreement except for the missing volume of waste (~20%) in TWDB.

The difference in waste quantity between RWMIS and the known content code quantities was calculated and assigned to a pseudo content code, 9999. A waste mass was calculated for this code by using the average density of all other content codes and the above calculated volume. This calculation assumes that content code 9999 composition is similar to the other waste with known content codes.

6.3 Waste Matrix Component Data

Table 3 contains estimated bulk waste matrix component information. Fields in addition to the common fields included in this section are:

<i>Matrix code</i>	A matrix code per DOE waste treatability group guidance, DOELLW-217, Rev 0, January 1995.
<i>Component</i>	Waste media or contaminant name.
<i>Concentration low level</i>	Estimated lower concentration level.
<i>Concentration typical</i>	Estimated typical concentration level.
<i>Concentration upper level</i>	Estimated upper concentration level.
<i>Units</i>	Concentration units.

6.4 Radionuclide Contaminant and Alpha Activity Concentration Data

Table 4 provides radionuclide and alpha activity waste characterization data as derived from analysis of the INEL TWDB database. This database reports radionuclide information at the container level with content code information making possible summaries at the waste stream level, however, it reports information for only two primary radionuclides. It should be noted that the radionuclide and activity information provided per waste stream may represent a subset of that waste stream and in total represents a subset of the total estimated activity as highlighted in section 6.2. However, the information does provide useful information primarily for the alpha activity. Reference should be made to Section 4 of this report for additional information on other radionuclides, information sources and activity.

The TRU alpha activity reported consists of alpha-emitting transuranium radionuclides (an alpha-emitting radionuclide having an atomic number greater than 92 and half-life greater than 20 years). All transuranium decay chain progeny classified as TRU are included. All activity calculations are based on a 15-year post purification date, or decay date. Fifteen years is a representative waste age average.

Values of gross mass presented in the tables are based on stored quantities for which radiological data are available. For this reason, these values may not agree with those reported in the storage inventory section. Gross mass refers to container mass plus waste mass. Waste mass refers to the mass of the waste only, and does not include the mass of the container. Both are provided in the event some of the waste may be treatable after container removal.

In addition, it should be noted that Pu-52 and Pu-83 are database nomenclature for weapons-grade plutonium (WG Pu) and heat-source plutonium (HS Pu), respectively. The reader is referred to Section 4 for the nominal isotopic compositions of these mixtures.

Information for each waste stream is divided into two major parts. The first part, Alpha Activity Concentration Profile, uses the transuranic alpha activity concentration intervals identified in Table 6-2. Since transuranic alpha activity concentration is currently the fundamental unit for classifying and managing defense-generated waste forms, these intervals were chosen to provide a more complete representation of the waste within a designated waste stream (content code). It should be noted that due to limitations of the nondestructive assay equipment, alpha activity concentrations below 100 nCi/g are not measured with a high degree of confidence. Therefore, the lowest interval used is

$$0 \leq \text{TRU alpha activity concentration} < 100 \text{ nCi/g.}$$

Because alpha low-level waste is by definition less than 100 nCi/g, all waste described in Appendix A (ALLW) is categorized within Interval 0.

In the second part, Isotopic Composition Profile, radionuclides present in the designated waste stream (content code) are identified. The mass (in grams) of each radionuclide is tabulated. In addition, the associated TRU alpha activity, non-TRU alpha activity, and total alpha activity are provided per gram of gross mass and per gram of waste mass, respectively, for each radionuclide. For explanation of the determination of TRU and non-TRU alpha activity, see Section 4 of this report.

The term "gross mass" is defined as the net container mass plus mass of the waste within the container. In contrast, "waste mass" is defined as the mass of the waste in the container. Waste mass does not include the mass of the container. In cases where liners or other packaging materials have been used, the weight of these materials is considered part of the waste mass. For conversion from gross mass to waste mass, the following empty container weights are commonly used:

Drum (55 gal)	50 lbs (22.7 kg)
Box (4 × 4 × 7 ft)	620 lbs (281.2 kg)
Bin (4.2 × 4.9 × 6 ft)	676 lbs (306.6 kg)

A brief description of each column heading used in Section E is provided below.

Alpha Activity Concentration Profile

Interval Number Transuranic alpha activity concentration interval from Table 6-2.

Table 6-2. TRU alpha activity concentration intervals.^a

Interval number	Interval description

a. EDF RWMC-716, 3/4/94.

b. TRU alpha activity concentration per gross mass (nCi/g).

<i>TRU Alpha Activity Concentration</i>	TRU alpha activity concentration interval description.
<i>Interval Gross Mass (kg)</i>	The total gross mass within the specified interval.
<i>Interval Waste Mass (kg)</i>	The total waste mass within the specified interval.
<i>Isotopic Composition Profile</i>	
<i>Major Nuclide/Pu Mix</i>	The major radionuclide(s) or plutonium mixture(s) reported present in the waste are identified. Radionuclides for which data are reported are shown in Section 4, Table 4-5. Pu-52 and Pu-83 are database nomenclature for weapons-grade plutonium (WG Pu) and heat-source plutonium (HS Pu), respectively. The reader is referred to Section 4, Table 4-6 for the nominal isotopic compositions of these mixtures.
<i>Nuclide/Pu Mix Mass (g)</i>	The mass, in grams, of the radionuclide or plutonium mixture present.
<i>Nuclide/Pu Mix Mass per Gross Mass (g/g)</i>	The concentration of the radionuclide or plutonium mixture in the waste (in grams) per gram of gross mass.
<i>TRU Alpha Activity per Gross Mass (nCi/g)</i>	The transuranic alpha activity concentration in the waste in nanocuries per gram of gross mass.
<i>Non-TRU Alpha Activity per Gross Mass (nCi/g)</i>	The nontransuranic alpha activity concentration in the waste in nanocuries per gram of gross mass.
<i>Total Alpha Activity per Gross Mass (nCi/g)</i>	The sum of TRU alpha activity mass plus non-TRU alpha activity per gross mass.
<i>Nuclide/Pu Mix Mass per Waste Mass (g/g)</i>	The concentration of the radionuclide of plutonium mixture in the waste in grams per gram of waste mass.
<i>TRU Alpha Activity per Waste Mass (nCi/g)</i>	The transuranic alpha activity concentration in the waste in nanocuries per gram of waste mass.
<i>Non-TRU Alpha Activity per Waste Mass (nCi/g)</i>	The nontransuranic alpha activity concentration in the waste in nanocuries per gram of waste mass.
<i>Total Alpha Activity per Waste Mass (nCi/g)</i>	Sum of the TRU alpha activity per waste mass and non-TRU alpha activity per waste mass.

6.5 EPA Hazardous Contaminant Data

Table 5 identifies hazardous constituents as defined under the Resource Conservation and Recovery Act (RCRA) reported to be present in the waste. Hazardous waste code number(s), associated hazardous waste descriptions, and baseline contaminant concentrations are reported to assist in treatment facility design. This section only includes mixed wastes.

In addition to the common fields, the following fields appear in this table.

<i>Ucode</i>	An INEL code used to link the EPA code with the RCRA category and subcategory.
<i>EPA Code</i>	The hazardous waste number [as defined in Title 40 of the Code of Federal Regulations Part 268 (40 CFR 268)] for the constituent reported.
<i>Category</i>	Hazardous waste description as defined in 40 CFR 268.
<i>Subcategory</i>	Treatment subcategory as defined in 40 CFR 268.
<i>CAS #</i>	Chemical abstract system number for chemical constituent.
<i>Estimated Concentration (wt%)</i>	Estimated concentration of constituent present in the waste.
<i>Estimated Maximum Concentration (wt%)</i>	Estimated maximum concentration of hazardous constituent present in the waste.

Source information used to identify the presence of contaminants was in accordance with the current INEL FFCA database and supporting documentation used for compliance of the Federal Facilities Compliance Act reporting requirements. Information provided to comply with these reporting requirements contained estimated listings of contaminants present in the waste; however, definitive information on contaminant concentrations present in the waste is not available at this time. Further document review for presence of contaminants resulted in the additional listing of some constituents in a few of the waste streams.

The concentration information presented in this table was derived from engineering review and estimation. Additional compilations and assumptions were made in order to expand and quantify concentration values and present bounding estimates. Confidence in the accuracy of the estimated concentration values is low, however this information is considered the best available at this time.

Estimated maximum concentrations are considered to represent bounding values for listed constituents with a margin of conservatism. The intent of this presentation is to provide a consistent basis for use in preparation and evaluation of proposals for treatment services. Waste stream or content code entries showing no concentration values indicate that no information was available.

7. INFORMATION FOR USE WHEN NO OTHER WASTE DATA OR INFORMATION ARE AVAILABLE

For some content codes, data may be unavailable. The lack of data may be for several reasons, including incomplete historical records, or data needs (i.e., presence of RCRA constituents) identified after waste collection and storage records were completed many years ago.

This section has been prepared to provide the reader with base case waste characterization data for use when no known data for a waste stream are available. These base case data are designed for use in waste treatment studies or other instances where a complete set of waste characterization data for the wastes are required. Use of these base case data will reduce assumptions or other conclusions drawn from an incomplete data set for these waste types.

A set of "design basis" data for the ALLW and TRUW is provided in this report section. This data provides information considered "typical" of the INEL stored mixed and non-mixed alpha low-level waste and mixed and non-mixed transuranic waste. The waste matrix/source characteristics of this base case are specified in a manner that reasonably approximates a significant fraction of the overall inventory population. For such base case data to be reasonable, consideration must be given to nominal matrix compositions, source mass, and source compositions. This has been accounted for in the preparation of this data. The resultant source mass and waste concentration data to be applied to empty record cases is reasonable in terms of the actual characteristics of the INEL stored wastes.

The base case data for the alpha low-level waste^a presented in this report are based on a typical solidified waste form. Values are based on one 55-gallon sludge drum weighing 475 lbs (216 kg) gross mass, 400 lbs (182 kg) waste mass. The source composition of the sludge is comprised of a nominal WG Pu composition at 15 years post purification at a mass per container of 0.2 grams. In addition, the sludge contains a mixture of RCRA hazardous constituents, primarily organic chemicals. Design base case data are presented on pages 7-5 to 7-10.

The design case data for the transuranic waste^b presented in this report are based on a typical drum filled with a heterogenous waste mixture of combustibles and lead. Values are based on one 55-gallon drum weighing 175 lbs (79.4 kg) gross mass, 100 lbs (45.5 kg) waste mass. The source composition is comprised of a nominal WG Pu composition at 15 years post purification at a mass per container of 2.5 grams. In addition, the waste contains lead, which is a RCRA hazardous constituent. Design base case data are presented on page 7-11 to 7-16.

It is suggested that the values in the base cases be used only where no data are available. Examples for use are shown as follows.

a. Design base case data for ALLW from M. L. Apel, G. K. Becker, Z. K. Ragan, J. Frasure, B. D. Raivo, L. G. Gale, and D. P. Pace, *Radiological, Physical and Chemical Characterization of Low-Level Alpha Contaminated Wastes Stored at the Idaho National Engineering Laboratory*, Idaho National Engineering Laboratory, EG&G Idaho, Inc., EGG-RWMC-11189, March 1994.

b. Design base case data for TRUW from M. L. Apel, G. K. Becker, Z. K. Ragan, J. Frasure, B. D. Raivo, L. G. Gale, and D. P. Pace, *Radiological, Physical and Chemical Characterization of Transuranic Wastes Stored at the Idaho National Engineering Laboratory*, Idaho National Engineering Laboratory, EG&G Idaho, Inc., EGG-RWMC-11190, March 1994.

Alpha low-level waste:

Example 1: The INEL waste stream ID-INL-155 does not report hazardous constituent data.

Page 7-7 provides a listing of eight EPA Hazardous Waste Codes and associated data are provided. These data include an estimated concentration (wt%) and assumed maximum concentration (wt%) for each of these constituents.

To complete the waste characterization data for INEL waste stream ID-INL-155, the reader should use the chemical constituents, estimated constituent concentrations, and assumed maximum constituent concentrations provided on page 7-7.

This process is to be implemented for the remaining chemical constituents of interest.

$$\begin{aligned} \text{DES-BASIS-ALLW Methanol Conc} \times \text{Gross Mass ID-INL-155} \\ = \text{Mass Methanol in ID-INL-155} \end{aligned} \quad (7-1)$$

Example 2: The INEL waste stream ID-RFO-328 does not report alpha activity concentration or isotopic composition data.

Pages 7-8 and 7-9 provide activity and composition data. In this profile sheet, one radionuclide mixture (Pu-52, weapons-grade plutonium) is identified. The TRU and non-TRU alpha activity concentration data for this contaminant are also provided using both a gross mass (216 kg) and waste mass (182 kg).

To complete the waste characterization data for INEL waste stream ID-RFO-328, the reader should use the design basis radionuclide mixture, Pu-52. To determine the mass of Pu-52 in ID-RFO-328, the Pu Mix Mass/Gross Mass concentration in ID-RFO-328 must be normalized to the respective Design Basis Case concentration. This normalization and determination of the associated mass of Pu-52 in ID-RFO-328 is done as follows:

$$\text{Design Basis Pu-52 concentration} = \frac{\text{Mass of Pu-52 in DES-BASIS-ALLW}}{\text{Gross Mass in DES-BASIS-ALLW}} \quad (7-2)$$

$$\begin{aligned} \text{Design Basis Pu-52 concentration} \times \text{Gross Mass ID-RFO-328} \\ = \text{Pu-52 mass in ID-RFO-328} \end{aligned} \quad (7-3)$$

In this example,

$$\text{Design Basis Pu-52 concentration} = \frac{0.2 \text{ g Pu-52}}{216,000 \text{ g Gross Mass}} \quad (7-4)$$

$$\text{Design Basis Pu-52 concentration} = 9.27\text{E-}07 \frac{\text{g Pu-52}}{\text{g Gross Mass}} \quad (7-5)$$

$$9.27\text{E-}07 \frac{\text{g Pu-52}}{\text{g Gross Mass}} \times 78,000 \text{ g Gross Mass} = 0.0702 \text{ g Pu-52 in ID-RFO-328} \quad (7-6)$$

Therefore the total alpha activity for ID-RFO-328 would be estimated as 5.74E+06 nanocuries by the following equation.

$$0.072 \text{ g Pu-52} \times 7.977E-02 \frac{\text{Ci}}{\text{g Pu-52}} \times 1.0E+09 \frac{\text{nCi}}{\text{Ci}} = 5.74E+06 \text{ nCi TRU } \alpha \text{ activity} \quad (7-7)$$

To obtain the TRU alpha activity concentration, the TRU alpha activity computed above is divided by the gross mass in ID-RFO-328 as shown below. The conversion factor used to convert Pu-52 mass to TRU alpha activity (in Ci) is found in Table 4-6.

$$\frac{5.74E+06}{78,000} \frac{\text{nCi TRU } \alpha \text{ activity}}{\text{g Gross Mass ID-RFO-328}} = 73.6 \frac{\text{nCi}}{\text{g Gross Mass}} \quad (7-8)$$

The non-TRU alpha activity per gross mass, TRU alpha activity per waste mass, and non-TRU alpha activity per waste mass are determined in a similar manner. Since the gross mass is the same, the total alpha activity per gross mass is determined by summing the TRU alpha activity per gross mass and the non-TRU alpha activity per gross mass. A parallel calculation is performed for the total alpha activity per waste mass.

Example 3: The INEL waste stream ID-RFO-000 does not report Waste Matrix Constituents data.

Page 7-10 provides matrix data. In this profile sheet, an estimated typical matrix composition for a sludge drum is presented.

To complete the waste matrix constituent characterization data in waste stream ID-RFO-000, the reader should use the mass fraction data presented on page 7-10, Section F. For example, to compute the total mass of a given constituent in ID-RFO-000, the reader should multiply the respective Composition (wt%) value by the gross mass in ID-RFO-000. To illustrate:

$$\text{Mass Oil-dri in ID-RFO-000} = \text{Wt\% Oil-dri in DES-BASIS-ALLW} \times \text{Gross Mass in ID-RFO-000} \quad (7-9)$$

$$600 \text{ kg Oil-dri} = 1.0 \text{ Wt\%} \times 60,000 \text{ kg} \quad (7-10)$$

Note: This method will yield a rough estimate acceptable for use when no data are available. For the waste streams that contain composition data, the mass of the container and any liner is *not* included in the wt% breakdown.

Transuranic waste:

Information for the transuranic waste for when no data is identified in the profile sheets is obtained in a similar manner to the above examples, using the page 7-11 to 7-16 information.

E. Design Basis Radionuclide and Alpha Concentration Information

ALPHA ACTIVITY CONCENTRATION PROFILE

Interval Number	TRU Alpha Activity Concentration	Interval Gross Mass (kg)	Interval Waste Mass (kg)
0	nCi/g < 100	2.16E+02	1.82E+02
Totals		2.16E+02	1.82E+02

1. The TRU alpha activity concentration reported in this section consists of alpha-emitting transuranium radionuclides (i.e. radionuclide having an atomic number greater than 92 and half-life greater than 20 years). All transuranium decay chain progeny classified as TRU are included. All activity calculations are based on a 15 year pretreatment date or decay date. Fifteen years is a representative waste age average.

2. Values may not agree with those reported in Section C since values in this table are based on stored waste quantities for which radiological data are available.

3. Pu-238 and Pu-239 are database nomenclature for weapons grade plutonium (WG Pu) and heat source plutonium (HS Pu), respectively. See Section 2 Table 2.2 for the nominal isotopic compositions.

4. Gross Mass=Container net mass+waste mass. Waste Mass = Mass of Waste only.
