EXECUTIVE SUMMARY

This document identifies certain characteristics of the Advanced Mixed Waste Treatment Project (AMWTP) waste inventory that present significant challenges to processing for offsite disposal. To date, approximately 10,000 containers (both drums and boxes) of challenging wastes have already been retrieved from the wastes buried at AMWTP. It is estimated that the AMWTP inventory still contains about 35,000 additional containers of challenging waste that have not been retrieved yet.

For each challenging waste, this report provides a range of disposition approaches and the estimated costs to process those wastes. Remediation of this waste will require the construction of new processing tents, purchase of specialized equipment, and for some waste treatment to meet land disposal restriction limits. The total cost to achieve remediation by 2014 is estimated to be approximately \$94 million.

Appendix A contains a spreadsheet that was used to quantify financial calculations, and Appendix B lists the AMWTP identification numbers for containers of challenging waste that have already been retrieved.

Advanced Mixed Waste Treatment Facility
AMWTP Challenging Waste Forms and Disposition

1.0 Introduction

The Advanced Mixed Waste Treatment Project (AMWTP) waste inventory includes challenging waste forms that require processing and treatment beyond the characterization required for disposal at the Waste Isolation Pilot Plant (WIPP). This document summarizes those waste forms. Some of the waste requires significant work to meet waste acceptance criteria (WAC) at disposal facilities. In some instances, the work required is beyond current AMWTP capabilities. All of this waste requires disposition.

For wastes that have already been retrieved, Appendix B lists the inventory of AMWTP challenging waste forms by container number. This report also provides the projected inventories for containers that have not yet been retrieved. The projected inventories were estimated using the inventory of containers located in the Transuranic Storage Area – Retrieval Enclosure (TSA-RE), the rejection/generation rates experienced to date, and acceptable knowledge (AK). For all of this waste the applicable regulatory requirements, disposition approaches, and equipment/work needs are presented. The final section in this document is a cost estimate to qualify this waste for offsite disposal.

Table 1 summarizes the different types of challenging waste and the number of containers of each waste type. It includes numbers of drums that have already been retrieved as well as projected numbers of containers yet to be retrieved. Within Table 1, each container is counted only once, even though some of the containers are associated with more than one challenge. That means that some category totals will appear inconsistent with other tables within this report.

A good example of this seeming inconsistency can be seen in the drums that have indeterminate assays. A total of 1,210 drums have indeterminate assays. Of these, 805 have no other concern, but 396 of the 1,210 drums also are lead-lined, and four are non-defense related. Additionally, three drums with indeterminate assays also contain entrained liquids and two have containerized liquids. Each drum, however, is only counted once in the “Retrieved Containers” column; i.e., the 4 non-defense drums and the 396 lead-lined drums are not added into the “Indeterminate Assay” row total.

Significant effort was put into the generation of this document and the reported inventories and costs. It should be noted, however, that the inventory numbers are estimates as of the issuance date of this report. They will not be exact. These numbers should be used as indicative of the total number of challenging waste forms that will be encountered. In an analogous fashion, the processing throughputs are best estimates. Efficiencies may be identified that could reduce cycle times. Alternately, challenges not identified to date may also be encountered that could slow processing. In spite of the above disclaimers, the conclusions drawn in this document are accurate for planning and estimating.

AMWTP Challenging Waste Forms and Disposition

2.0 Challenging Waste Forms

2.1 Non-Defense

By law, the WIPP can accept only transuranic (TRU) radioactive waste that was generated by atomic energy defense activities of the United States (Public Law 102-579, 106 Stat. 4777, 1992, Waste Isolation Pilot Plant Land Withdrawal Act). The Department of Energy (DOE) and its predecessor agencies were engaged in a broad range of activities that fall under the heading of atomic energy defense activities. A TRU waste is eligible for disposal at the WIPP if it has been generated in whole or in part by one or more of the following functions:

- Naval reactors development
- Weapons activities, including defense inertial confinement fusion
- Verification and control technology
- Defense nuclear materials productions
- Defense nuclear waste and materials by-products management
- Defense nuclear materials security and safeguards and security investigations
- Defense research and development.

Using acceptable knowledge, DOE sites must determine that each waste stream to be disposed of at the WIPP is defense-related TRU waste. Waste that is not defense related cannot be disposed of at the WIPP. In addition, waste disposition to the WIPP waste must be TRU. That is, the waste must contain alpha-emitting transuranic isotopes with half-lives greater than 20 years. A TRU isotope is any isotope of any element having an atomic number greater than uranium (i.e., 92). Waste streams that are not defined as TRU or that do not contain a TRU isotope cannot be disposed of at the WIPP.

2.1.1 Inventory Evaluation

The AMWTP has approximately 2,347 m³ of waste that currently does not meet the definition of defense waste.

2.1.1.1 Retrieved Inventory

The retrieved and unretrieved non-defense generated waste inventory is given in Table 2. These data were identified by generator item description codes (IDC) and are based on a March 11, 2008, Waste Tracking System (WTS) query and the Transuranic Waste Management Information System (TWMIS). Included in this group are wastes identified as non-defense waste (TRU and non-TRU) and defense-related non-TRU waste (Bettis). AMWTP container

Advanced Mixed Waste Treatment Facility
AMWTP Challenging Waste Forms and Disposition

identification numbers for the retrieved containers are provided in Appendix B. A summary of this waste is given below.

Non-Defense TRU

The following waste forms are not defense related and likely TRU:

- Mexican americium waste is ^{241}Am -contaminated scrap processing equipment, recovered from an abandoned smoke-detector factory in Mexico.
- The Monsanto corporation generated TRU waste from non-defense-related processing at a laboratory located in Dayton, Ohio. This waste is not related to the waste generated at the Mound Laboratory located in Miamisburg, Ohio, although both were managed by Monsanto.
- Argonne National Laboratory-East (ANL-E) waste shipped to the Idaho National Laboratory (INL) includes both defense and non-defense waste. The AK to support characterization of this waste has not been collected in its entirety or summarized.
- Argonne National Laboratory-West (ANL-W; now called the Materials and Fuels Complex, or MFC) is an INL facility that shipped both defense and non-defense waste to the Radioactive Waste Management Complex (RWMC). A defense determination has been drafted but has not been submitted for CBFO approval.

2.1.1.2 Projected Inventory

A summary of the projected inventory is given in Table 2.

Advanced Mixed Waste Treatment Facility

Advanced Mixed Waste Treatment Facility
AMWTP Challenging Waste Forms and Disposition

2.1.2 Disposition Approaches

For all wastes identified in Table 2, it will be necessary to:

- Collect sufficient documents to support development of AK and characterization for shipment of waste to the WIPP, the Nevada Test Site (NTS) or Energy Solutions.
- Determine if any treatments or repackaging are required to meet requirements (e.g., Land Disposal Restrictions (LDR), Toxic Substances Control Act (TSCA), Resource Conservation and Recovery Act, Department of Transportation regulations, and the appropriate facility WAC).
- Evaluate the possibility of a defense determination. If waste is defense-related, a letter will need to be generated to declare the defense-related pedigree.
- If a defense determination cannot be made for a TRU waste, treatment would be required. Possible treatments that could be used to reduce the overall activity to below 100 nCi/g include:
 - Debris washing/decontamination
 - Macro encapsulation
 - Sort and segregate.
- Once the waste is rendered below 100 nCi/g TRU activity, the waste can then be disposed at the NTS.
- Evaluate other waste options, such as shipping as Greater-than-Class-C, where appropriate.

2.1.3 Equipment/Work Needs

- Currently the AMWTP does not have the capability to perform debris washing or decontamination. Disposition of the rinsate could be problematic.
- An approved on-site macro-encapsulation process would need to be developed and approved, and an appropriate facility constructed.
- A sort-and-segregation process would need to be employed.

2.2 Lead-Lined Containers

Two WIPP characterization parameters are complicated by the presence of lead liners: determining the unshielded dose rate and verifying the absence of prohibited items. The WIPP WAC limits the external radiation dose rate of individual payload containers to ≤ 200 mrem/hr at

Advanced Mixed Waste Treatment Facility
AMWTP Challenging Waste Forms and Disposition

the surface with the exception of the S100 pipe overpacks, which are limited to \leq 179 mrem/hr at the surface. Internal payload container shielding cannot be used to meet this criterion, except for authorized shielded payload container configurations such as the use of 55-gallon drums containing a pipe component. Lead-lined waste is considered shielded and cannot be shipped until it has been properly characterized. In order for lead-lined drums to be shipped in a Transuranic Package Transporter-Model II (TRUPACT-II) as contact-handled (CH) waste, the unshielded container surface dose rate must be determined to be \leq 200 mrem/hr. If the unshielded surface dose rate is $>$ 200 mrem/hr then the container is RH waste. The AMWTP is not certified for characterization or transportation of RH waste. In addition, to qualify for disposal at the WIPP, a successful real-time radiography (RTR) or visual examination (VE) must be performed to ensure the absence of prohibited items. Lead liners make it difficult, using current RTR configurations, to accurately determine the presence or absence of prohibited items.

2.2.1 Inventory Evaluation

Lead-lined waste containers include drums and boxes from RF and BL. A brief description of both is given below.

RF Lead-Lined Waste

- The RF best-management practice was to package all waste generated from the ^{241}Am product line in lead-lined containers. Typically the lead used at RF was either 1/16 or 1/8 inch thick. There were times, however, when additional shielding was added. Due to the shielding, it is difficult to determine if the containers have an unshielded surface dose rate less than 200 mrem/hr or if they are RH waste.
- Waste generated from the RF ^{233}U box line contains a significant quantity of ^{233}U and ^{232}Th isotopes, which pose handling problems due to their higher activity. The RF best-management practice was to package waste from the ^{233}U box line in lead-lined containers, irrespective of activity.
- The AMWTP has drums containing sealed sources (i.e., wrapped in lead sheeting or packaged in lead-lined inner containers). Although none of the containers identified in Appendix B are for sealed source containers, they require case by case evaluation and may be included in the Prohibited Item Removal/Liquid Remediation section of this document as impenetrable items.

BL Waste

- The BL wastes consist of ^{233}U - or ^{232}Th -containing materials generated during development of the LWBR for the Shippingport Station, a civilian reactor station. Bettis ^{233}U -contaminated waste consists of unirradiated ^{233}U fabricated fuel materials, scrap, and debris wastes that were generated during the development of the LWBR during the 1970s. The material is in the form of single rods and loose pellets and was generated during fabrication of the LWBR fuel.

Advanced Mixed Waste Treatment Facility
AMWTP Challenging Waste Forms and Disposition

2.2.1.1 Retrieved Inventory

The retrieved and characterized inventory of lead-lined waste containers from the RF²⁴¹Am and ²³³U lines is summarized in Table 3. This inventory is estimated to have a total volume of 108 m³.

Table 3. Number of retrieved lead-lined containers for RF waste by IDC.

	TOTALS	0	836	836	14	1139	1,153	1,989	486.08

The inventory of retrieved lead-lined containers by container identification numbers is given in Appendix B. To date, 476 RF drums, 3 RF boxes, and 836 BL drums have been identified as retrieved.

2.2.1.2 Projected Inventory

It is projected that AMWTP has yet to retrieve 416 lead-lined RF containers and 1,153 BL containers.

- Approximately 1% of the RF-retrieved waste containers have been lead-lined. This percentage is expected to apply to the current population (5,000) of retrieved, uncharacterized containers, indicating an additional 50 lead-lined containers. None of the projected Rocky Flats lead-lined inventory is expected to be in boxes.

Advanced Mixed Waste Treatment Facility
AMWTP Challenging Waste Forms and Disposition

- Based on the ratio of retrieved lead-lined containers to unretrieved containers of the same IDC and AK, the projected unretrieved RF lead-lined inventory is estimated at 408 drums and 8 boxes.
- The total population of unretrieved BL lead-lined containers is 14 boxes and 1,139 drums, as presented by IDC in Table 4.

2.2.2 Disposition Approaches

To characterize the lead-lined waste, the following would need to be performed:

- Determine the unshielded contact dose rates.
 - Determining that the dose rate is \leq 200 mrem/hr requires use of a software package such as MicroShield.
- Evaluate x-ray or radiography options, such as upgrade to penetrate the lead lining.
 - Upgrade and obtain certification for the WMF-610 RTR unit to facilitate characterization of the lead-lined containers. The geometry of this unit is favorable for examination of lead-lined containers.
 - Upgrade or reconfigure RTR unit(s) to provide more penetration for examination. This modification may be as simple as moving the container closer to the unit or reducing the tunnel size of an RTR unit for use with lead-lined containers, followed by re-training of operators in the RTR technique for lead-lined containers.
- Evaluate the performance of VE on containers with lead shielding that prevents successful RTR examination.
- Transfer any RH waste found to the Idaho Completion Project (ICP) contractor for waste characterization.
- Repackage waste in the Advanced Mixed Waste Treatment Facility (AMWTF) box lines to facilitate characterization and certification.
- Dispose as mixed low-level waste where appropriate.

2.2.3 Equipment/Work Needs

- Non-Destructive Assay (NDA)/RTR upgrades.
- Hot cell to perform VE and repackaging.

Advanced Mixed Waste Treatment Facility
AMWTP Challenging Waste Forms and Disposition

2.3 Remote Handled Waste

Waste with a surface dose rate greater than 200 mrem/hr is designated as remote-handled (RH) waste. The AMWTP is not certified to characterize RH-TRU waste. In addition, the AMWTF has a dose rate acceptance limit of 200 mrem/hr.

2.3.1 Inventory Evaluation

Using a list provided by DOE-ID, the AMWTP has recently completed evaluating lead-lined RF containers that are suspected to be above the threshold for RH waste. In addition, one unshielded container (container 10091619) at the AMWTP has a measured surface dose rate greater than the 200 mrem/hr threshold for RH waste.

2.3.1.1 Retrieved Inventory

Container 10091619, which is a fiberglass reinforced plywood box containing IDC RF-480, [Non-special Source Metal](#), has a measured surface dose rate of 250 mrem/hr, making it RH waste.

The containers that were on the list provided by DOE-ID have been modeled for determining an unshielded dose rate. The results of that modeling indicate that about 70 containers may have an unshielded surface dose rate greater than 200 mrem/hour. These containers are, therefore, suspected to be RH waste.

2.3.1.2 Projected Inventory

Two containers were surveyed with dose rates significantly greater than 200 mrem/hr. These containers were left in place and not retrieved. It is not known if these containers are TRU.

Two hundred fifty-two containers within the ANL-W inventory (Table 2) require a more detailed evaluation relative to RH determination. This waste is described as being generated from analysis of post irradiated nuclear fuel assemblies and material for the fast breeder reactor test programs.

Ravio has identified 216 containers from ANL-E as RH waste

Based on the percentage of lead-lined containers that are suspected to be RH waste and the estimated number of lead-lined containers, it is projected that about 75 RF lead-lined containers will be RH.

2.3.2 Disposition Approach

- Transfer identified RH-TRU waste to the ICP contractor.
- Modify AMWTF acceptance criteria for processing container > 200 mrem/hr.

Advanced Mixed Waste Treatment Facility
AMWTP Challenging Waste Forms and Disposition

2.3.3 Equipment/Work Needs

- A facility will be needed to sort and segregate RH waste.

2.4 High Fissile Gram Equivalent Containers

The TRUPACT-II fissile gram equivalent (FGE) limits for waste payload containers and packages are given in Table 5. The Contact-Handled Transuranic Waste Authorized Methods for Payload Control (CH-TRAMPAC) limit is calculated as the measured value plus two times the standard deviation.

Table 5. CH-TRAMPAC FGE limits.

Payload Container	^{239}Pu FGE Limit
55- (excluding pipe overpacks), 85-, and 100-gallon drums	≤ 200
55-gallon drum configured as a pipe overpack (e.g., a standard, S100, or S200 pipe overpack)	≤ 200
Standard waste box (SWB)	≤ 325
TDOP	≤ 325

In addition, the AMWTP criticality case prevents the import of high FGE boxes (> 325 FGE) into the AMWTF. This limit is calculated as the measured value plus 1 standard deviation.

2.4.1 Inventory Analysis

Fifty-five-gallon drums can be loaded directly into SWBs; therefore, only drums > 325 FGE are identified as problematic. The AMWTP has containers with measured FGEs that range from 280 to 1,400 FGE.

2.4.1.1 Retrieved Inventory

A WTS query performed on February 21, 2008, showed that 24 drums and 65 boxes currently exceed 325 FGE.

2.4.1.2 Projected Inventory

AMWTP estimates that 50 drums and 70 boxes containing more than 325 FGE remain to be retrieved and characterized. This estimate was made from historical data projected across the remaining inventory.

Advanced Mixed Waste Treatment Facility
AMWTP Challenging Waste Forms and Disposition

2.4.2 Disposition Approaches

- Modify the criticality controls of the DSA to allow processing of containers that exceed the FGE limits.
- Repackage waste outside of the AMWTF.

2.4.3 Equipment/Work Needs

- Repackaging facility with the ability to screen for hot activity locations.

2.5 Indeterminate Assays

Disposal of waste at the WIPP requires a valid assay. Disposal at an offsite facility also requires defendable knowledge that the container is below a given activity concentration. An indeterminate assay is defined as a drum with a total alpha activity concentration that is below the lower limit of detection (LLD), but for which the LLD is currently greater than 100 nCi/g. Drums that contain large amounts of non-TRU radionuclides (e.g., uranium, thorium) that interfere with the characterization of the TRU radionuclides may have LLD values greater than 100 nCi/g. In addition, drums with a very low net weight may yield an indeterminate assay.

2.5.1 Inventory Evaluation

The AMWTP has containers with indeterminate assays.

2.5.1.1 Retrieved Inventory

Currently, 1,210 drums have indeterminate assays. These containers are given in Appendix B.

2.5.1.2 Projected Inventory

- The unretrieved 1,152 BL waste containers are expected to have indeterminate assays.
- An additional 700 Rocky Flats waste containers are expected to have indeterminate assays.

2.5.2 Disposition Approaches

- Modify the data acquisition sequence to reduce the LLD.
- Repackage the low net weight drums to increase the net weight.
- Supercompact the low net weight drums to increase the net weight of the waste.

Advanced Mixed Waste Treatment Facility
AMWTP Challenging Waste Forms and Disposition

- Overpack the drums with indeterminate assays into an SWB with drums having a determinate assay value for counting on the Super High Efficiency Neutron Counter (SuperHENC).

2.5.3 Equipment/Work Needs

- Modify NDA protocol to address or minimize interferences.

2.6 AMWTF-Rejected Boxes

The AMWTF rejects boxes that cannot be processed or have been deferred from processing. Boxes with one or more of the following issues are rejected:

- Contain homogeneous solid matrices (S3000/S4000), such as soil, sludges, concrete, and asphalt, which are not amenable to supercompaction.
- Exceed AMWTF weight limit.
- Contain prohibited items (PI), such as pressurized cylinders, aerosol cans, lead, mercury, or polychlorinated biphenyls (PCBs). Some of these items (e.g., cylinders/cans) may also be large objects that require extra work to process through AMWTF.
- Exceed the box size WAC for the AMWTF. The WAC typically requires that a box be no larger than 58.5 in. wide by 76.4 in. high and 96 in. long with a tolerance of 2 inches in all dimensions.
- Contain heavy, dense objects, which create two problems: (1) they are difficult to penetrate using RTR and create dark areas containing unknowns on the RTR video recordings and (2) they are likely to be large objects that require a significant amount of work to cut down to an appropriate size to process within the AMWTF.
- Contain large objects that require a significant amount of work to reduce in size and process through the AMWTF. Examples of problematic items are gloveboxes, drums, compacted drums, and I-beams.
- Overpacked fiberglass-reinforced plywood boxes (FRPs) with AMWTF-desirable IDCs. FRPs were cakeboxed primarily for container integrity (CI) issues and are difficult to un-overpack outside of a glovebox environment.
- Boxes with >325 FGE are not acceptable to the AMWTF. Those boxes are included in the discussion of high-FGE containers in Section 2.4, but they are not included in this section.

Advanced Mixed Waste Treatment Facility
AMWTP Challenging Waste Forms and Disposition

2.6.1 Inventory Analysis

2.6.1.1 Retrieved Inventory

The number of rejected boxes is summarized by problem area in Table 6. Boxes with multiple issues are identified only once in the table, based on the most difficult issue to address. For example, an overweight box that was overpacked and contained large objects is identified in the Overweight category. The order of priority is: Homogeneous Waste, Overweight, PI, Oversize, Heavy, Dense Objects, Large Items, Overpacked, and Unknown Issue.

Table 6. Number of rejected boxes as of 2/27/08 and reason for rejection.

Rejection Reason	Number of Boxes
Homogeneous Waste Matrix	11
Overweight	27
Prohibited Items	66
Oversized	1
Heavy, Dense	389
Large Objects–No Other Issue	246
Overpacked–No Other Issue	220
Rejection Issue Unknown	72
TOTAL	1,032

The AMWTF-reject boxes, a total of 1,032 boxes, are identified by AMWTP number in Appendix B.

2.6.1.2 Projected Inventory

The projected reject population was estimated for each problem category identified in Table 6. The number of boxes to be retrieved is an estimate based on the Raivo report, the current number of retrieved and characterized boxes (dated 3/17/08), TWMIS, and WTS queries. The assumptions and calculations used in each estimate are presented below.

Homogeneous Waste Matrices

Boxes containing homogeneous waste matrices (i.e., Waste Summary Category Groups S3000 and S4000) are not sent to the AMWTF for supercompaction. The identified path forward

Advanced Mixed Waste Treatment Facility
AMWTP Challenging Waste Forms and Disposition

for containers with homogeneous materials is the Mixed Low-Level Waste Program (MLLP). However many of these boxes have radioisotopic activities that prohibit their disposal at Energy Solutions or treatment at an off-site treatment facility for disposal at NTS. A summary of boxes rejected by the AMWTF due to the presence of homogeneous waste matrices and from the MLLW Program due to activities > 100 nCi/g is presented in Table 7. It is projected that 25 boxes may be rejected from the AMWTF and will not be acceptable for disposal through the MLLW Program.

Table 7. Estimated number of boxes containing homogeneous solid waste.

IDC	Boxes Accepted by AMWTF or MLLP	Rejected Boxes Containing Homogeneous Solids (2/27/08)	Boxes Not Yet Evaluated by AMWTF or MLLP	Estimated Boxes Containing Homogeneous Solids	Total Boxes Containing Homogeneous Solids

AMWTP Challenging Waste Forms and Disposition

Overweight

A WTS query identified the retrieved boxes that are overweight. A query of TWMIS was used to determine the number of yet to be retrieved boxes that will exceed the AMWTF weight limits. The number of retrieved containers by IDC that exceed the AMWTF weight limit and the number of boxes projected to be retrieved that will exceed the AMWTF weight limits are presented in Table 8. It is projected that approximately 38 boxes will not meet the current AMWTF weight limits.

Table 8. Estimated number of overweight boxes.

Unknown	7	-	7
TOTAL	27	11	38

Advanced Mixed Waste Treatment Facility
AMWTP Challenging Waste Forms and Disposition

Prohibited Items

The number of boxes identified as containing prohibited items (PI) is listed by IDC in Table 9. For each IDC, the number of boxes containing PI was compared to the number of boxes that had been accepted by AMWTF or the MLLW Program. This ratio was multiplied by the number of boxes yet to be evaluated to estimate the number of unretrieved boxes that may contain PI. It is projected that 171 boxes will have PI issues.

Table 9. Estimated number of boxes containing PI.

TOTAL	3,702	66	5,277	105	171

Advanced Mixed Waste Treatment Facility
AMWTP Challenging Waste Forms and Disposition

Oversized Boxes

The AMWTFs WAC for maximum box size is 58.5 in. wide, 76.4 in. high, and 96 in. long, with a tolerance of 2 inches in all dimensions. Smaller containers are acceptable, provided that other WAC are met. To estimate the number of retrieved containers that exceed the AMWTF's box size WAC, the WTS was queried to identify any box with at least one dimension greater than 96 inches long, 60 in. wide, or 60 in. high.

The TWMIS query identified 105 containers that do not meet the AMWTF size limits, of which only one has been retrieved to date. Approximately 104 oversized boxes remain in the TSA-RE awaiting retrieval. Table 10 summarizes this information by IDC.

Table 10. Oversize box estimates.

a. Waste must be evaluated through AK to make defense determination.

Advanced Mixed Waste Treatment Facility
AMWTP Challenging Waste Forms and Disposition

Heavy, Dense Objects

The number of boxes that were identified with only the heavy, dense objects issue is listed in Table 11 by IDC. For each IDC, the number of boxes that were rejected for containing heavy, dense objects was compared to the number of boxes that had been accepted by AMWTF or the MLLW Program. This ratio was multiplied by the number of boxes yet to be retrieved to estimate of the number of unretrieved boxes that may contain heavy, dense items. It is projected that 931 boxes will contain heavy, dense items.

Table 11. Estimated number of rejected boxes due to heavy, dense objects only.

AMWTP Challenging Waste Forms and Disposition

Large Objects

The IDCs that were identified as having boxes with only a large-objects issue are given in Table 12. For each IDC, the number of boxes that contained large objects was compared to the number of boxes that had been accepted by AMWTF or the MLLW Program. This ratio was multiplied by the number of boxes yet to be retrieved to estimate the number of boxes that may contain large objects. It is projected that 627 boxes will contain large objects.

Table 12. Estimated number of rejected boxes due to large objects only.

Unknown	0	2	0	-	2
TOTAL	3,907	245	5,305	382	627

Overpacked FRPs

Fiberglass-reinforced plywood boxes (FRPs) were overpacked into “cakeboxes” primarily for container integrity (CI) reasons. So far, about 220 containers have required overpacking out of approximately 4,300 boxes that have processed in all. Thus, the rejection rate for CI issues is approximately 0.5%. Given the remaining box inventory, it is projected that 175 boxes will require overpacking.

2.6.2 Disposition Approaches

Low-activity boxes rejected by AMWTF will continue to be screened for acceptance under the MLLW Program. Those containers that are acceptable as MLLW (e.g., characterization sufficient, radioactivities that allow for acceptably low source terms) will be transferred to the MLLW Project. The remaining containers can be reviewed by RTR specialists to determine if the box will fall within one of following categories:

Advanced Mixed Waste Treatment Facility
AMWTP Challenging Waste Forms and Disposition

- Expert Technical Review can provide sufficient AMWTF data
- A re-RTR of the container would provide sufficient AMWTF data
- A VE of the open container would provide sufficient AMWTF data.

Boxes that cannot be shipped under the MLLW Project will require treatment at the AMWTF. AMWTF modifications can be completed to enhance operations and address part of this reject population. Modifications could include:

- Load cell changes to allow for acceptance of heavier boxes.
- Modification/replacement of the cutting/sizing tools inside the hot cell to reduce equipment maintenance and improve size reduction times in the box line.
- Methods for remediation of PI (e.g., gas cylinders or mercury) to allow for processing of the remaining box items. Two options for resolution of the PI issue(s) would then be:
 - o Remediation of the PI (e.g., cutting aerosol can) followed by supercompaction
 - o Removal of the PI (e.g., bag out or drum the PI) for treatment of the PIs elsewhere, such as the special-case waste (SCW) glovebox.

Rerecycling facilities are required to address several AMWTF-reject issues including boxes that:

- Exceed weight limits – repack into two or more containers that would meet weight limits.
- Exceed size limits – repack into AMWTF-acceptable boxes.
- Contain large objects – size-reduce the large objects and:
 - o package for treatment at the AMWTF or
 - o package into TRUPACT-II-acceptable containers for direct shipment to WIPP.
- Contain homogeneous solids – institute methods for removal and packaging of direct loaded sludges, soils, etc., and subsequent packaging for disposal at WIPP or treatment/disposal under the MLLW program.
- Are overpacked FRP boxes – repack to allow for AMWTF acceptance.

2.6.3 Equipment/Work Needs

- Upgrade to RTR equipment to allow examination of the larger, heavier boxes.

Advanced Mixed Waste Treatment Facility
AMWTP Challenging Waste Forms and Disposition

- Modifications to the box line to improve the ability to handle rejected overweight boxes, large objects, and equipment too large to be taken into existing facilities and to include the AMWTF-rejected drums (Section 2.1.6).
- A glovebox built to handle large boxes for repackaging with the type of equipment (e.g., crane) needed to: remove gloveboxes and large pieces of equipment from the original box, size-reduce the waste, and repackage for supercompaction or direct shipment.

2.7 Flammable Gas/Volatile Organic Compounds

Containers shipped in a TRUPACT-II must pass a CH Transportation Evaluation Software (CHTES) review to ensure no flammable gas mixture can occur in any layer of confinement during shipment. Containers that fail this evaluation cannot be shipped in a TRUPACT-II.

2.7.1 Inventory Analysis

Currently, the AMWTP has both 55- and 100-gallon drums that cannot be certified as compliant with TRUPACT-II limits due to high flammable gas generation rates or high volatile organic compound (VOC) concentrations.

Advanced Mixed Waste Treatment Facility
AMWTP Challenging Waste Forms and Disposition

2.7.1.1 Retrieved inventory

Table 13 summarizes the containers to date that have failed the CHTES evaluation for flammable gas generation rate or VOC concentrations.

Table 13. Estimated number of containers with flammable gas/VOC issues.

Waste Stream	Containers Evaluated through CHTES	Known High Flammability Containers	Estimated Containers Not Yet Evaluated through CHTES	Projected Containers With High Flammability	Total Containers With High Flammability

a. <LLD drums not included.
 b. <LLD drums included.
 c. Because all debris waste is projected to be compacted, all debris waste streams were rolled into the BN-510 LDF waste stream.

2.7.1.2 Projected Inventory

The percentages of containers with flammable gas issues within each waste stream and the current rejection rates were used to project the remaining inventory. This information is summarized in columns 4 and 5 of Table 14. It is projected that 168 containers will have flammable gas issues.

Advanced Mixed Waste Treatment Facility
AMWTP Challenging Waste Forms and Disposition

2.7.2 Disposition Approaches

Most containers with flammability-related problems have VOCs that are homogeneously distributed within their contents. Repackaging of these containers is not a suitable option for remediation because this treatment would result in two containers with flammability issues. The following alternatives could be used to address containers with high levels of flammable VOCs:

- Debris washing
 - The development and implementation of a process for treatment and disposition of secondary liquid waste would be necessary.
- Perform thermal desorption to accelerate VOC abatement.
- Autoclave technology.
- For sludge waste, the use of a modified Fenton's reagent could be used resulting in in-situ oxidation. This process would consist of injecting chelated iron catalysts and hydrogen peroxide into the contaminated sludge. Fenton's reagent is effective at destroying flammable VOCs. The use of a modified Fenton's reagent does not require acidic conditions within the container.
- Vacuum assisted thermal desorption.

2.7.3 Equipment/Work Needs

- Additional equipment such as a washing station, thermal desorption unit, autoclave, etc., and a glovebox or facility will be needed for whichever approach is chosen.

2.8 Roaster Oxides

Depleted uranium (DU) waste (fines, turnings, machining chips, etc.) was roasted at RF to convert the pyrophoric metal to a stable oxide called a roaster oxide (RO) before it was shipped to the INL. The chip roaster began operations in 1956 and operated consistently, with the exception of 1959 through 1961. The DU waste generated during that time was stored outside at RF and in 1961 was buried onsite at RF. Drums of RO may contain incompletely oxidized waste material. A pyrophoric reaction might occur if a drum containing incompletely oxidized RO were to be vented or otherwise exposed to air.

2.8.1 Inventory Evaluation

Containers of RO were shipped to the INL before 1971 and buried in the Subsurface Disposal Area (SDA). The only RO waste containers stored in the TSA-RE are those retrieved (September 1974 and July 1978) from Pits 11 and 12 during the Initial Drum Retrieval Project. One hundred twenty-seven drums of RO were reported as having been included in that retrieval.

Advanced Mixed Waste Treatment Facility
AMWTP Challenging Waste Forms and Disposition

Containers retrieved were packaged in bins, cargo containers, or 85-gallon drums and placed on the TSA pads.

2.8.1.1 Retrieved Inventory

None.

2.8.1.2 Projected Inventory

Although it has been previously reported that 127 drums of RO were retrieved from Pits 11 and 12, additional research using the “CARGO” and “MIII_BIN” tables in the TWMIS indicates a potential for additional RO drums. The TWMIS tables were filtered to determine a conservative estimate of potential DU waste containers. All containers that (1) were listed as being from buildings 444, 447, 883, and 865, or (2) were packaged in 30-gallon drums, or (3) had gross weights greater than 250 lb were assumed to contain RO. The results are presented in Table 14, which also includes data for containers with no identifiers (NOID) or other information available. The total of RO drums in the MIII Bins is equal to the number (127) of RO containers previously reported.

However, some discrepancies exist between the documents regarding the number of containers retrieved and the disposition of the containers. One document states that TRU waste was to be placed on Pad R, the 745 salt and the RO waste containers were to be placed on Pad A, and two containers that were determined to contain radioisotopic sources were reburied in Pit 15.

Table 14. Estimated number of containers of RO stored in the bins and cargo containers on Pad R.

Type	Bins	Cargo Containers	Total
RO/Building 444	15	333	348
RO/Building 883	1	76	77
RO/Building 865	0	2	2
RO/NOID 30 gal >250 lb	3	0	3
RO/NOID >250 lb	108	11	119
TOTAL	127	422	549

Because of the uncertainty regarding the location of the RO waste containers, before retrieving the cargo containers and the MIII bins stored on Pad R, additional safety measures should be considered to address the potential of a RO burn as experienced by the ICP while retrieving waste from Pits 4 and 6.

Advanced Mixed Waste Treatment Facility
AMWTP Challenging Waste Forms and Disposition

2.8.2 Disposition Approaches

- Open the containers in an inert atmosphere (e.g., nitrogen, argon) and perform treatment such as macro-encapsulation to stabilize the DU and prevent further oxidation reactions.
- Complete the oxidation processing by either roasting the DU at high temperature or allowing the DU to oxidize in an oxygen atmosphere in a controlled environment.
- Negotiate with the ICP contractor to transfer RO containers for disposition with the RO containers retrieved from the SDA.

2.8.3 Equipment/Work Needs

- Glovebox with an inert atmosphere and the equipment needed to repackaging and stabilize the waste.
- Uranium roaster oven.
- Glovebox or small facility with a controlled environment.

2.9 Nitrate Salts IDC RF-005

Based on AK, this waste stream is expected to be MLLW and will require LDR treatment before disposal.

2.9.1 Inventory Evaluation

All RF drums with a drum prefix of 745 are nitrate salts waste. Originally, there were five nitrate salt containers identified in the AMWTP inventory. However, this has turned out not to be the case.

2.9.1.1 Retrieved Inventory

As containers with nitrate salts have been retrieved the historical data have been added into the WTS tables. Currently, 963 retrieved nitrate salts containers are identified in WTS. These containers are included in the retrieved container inventory presented in Appendix B.

2.9.1.2 Projected Inventory

The projected inventories of nitrate salts drums presented in Table 15 are based on TWMIS entries specific to nitrate salts and those with no specific data, respectively.

- The unretrieved inventory of 142 containers identified in TWMIS are:
 - One hundred six listed in TWMIS by their prefix “745” and an IDC of RF-005.

Advanced Mixed Waste Treatment Facility
AMWTP Challenging Waste Forms and Disposition

- o Twenty “745” prefix drums listed in the TWMIS “MIII_BIN” table.
- o Sixteen “745” prefix drums listed in the TWMIS “CARGO” table.
- It is projected that an additional 1,089 drums of nitrate salts waste may be retrieved based on the following:
 - o An estimated 1,000 nitrate salts (RF-005) containers based on a visual inspection of Pad 1, Cell 3.
 - o Nine “745” containers stored in M-III bins, which is 10% of the 90 unidentified drums with greater than 300 lb gross weight, and
 - o Eighty “745” containers stored in cargo containers , which is 10% of the 797 unidentified drums with greater than 300 lb gross weight.

Table 15. Nitrate salts (RF-005) containers.

Nitrate Salts	Retrieved Containers of Nitrate Salts	Unretrieved Containers With 745 Drum Prefix ^a	Projected Additional Drums of Nitrate Salts	Total Containers of Nitrate Salts
Drums/Boxes	963	106	1,000	2,067
Bins		20	9	29
Cargo Containers		16	80	96
TOTAL	963	142	1,089	2,194

a. The unretrieved drums are those with a drum prefix of 745 reported in the TWMIS tables.

2.9.2 Disposition Approaches

Land Disposal Restriction (LDR) treatment and ship as mixed low-level waste (MLLW).

2.9.3 Equipment/Work Needs

MLLW program.

2.10 Not Identified in Historical Records

The Rocky Flats load lists from 1971 and 1972 are not in the AK record and are not included in the WTS or the TWMIS. There could be as many as 20,000 waste containers stored on Pad 1 in Cells 1 and 2 that are not currently identified in either database. The majority of these containers were shipped to the INL from RF, but other containers may have been generated by non-AMWTP INL facilities or other off-site DOE facilities.

Advanced Mixed Waste Treatment Facility
AMWTP Challenging Waste Forms and Disposition

2.10.1 Inventory Evaluation

It is assumed that these containers will fall into existing waste streams in a pro-rata basis.

2.10.1.1 Retrieved Inventory

None.

2.10.1.2 Projected Inventory

Estimated at 20,000 containers.

2.10.2 Disposition Approach

- Those identified as having been generated from other facilities will be evaluated on a case-by-case basis, to determine enough information for safe storage, such as contents and waste matrix code group (WMCG). Hazardous Waste Numbers will be assigned for storage based on all characterized/known wastes identified for the same WMCG.
- It may be necessary to collect additional AK documents to support characterization of waste not included in current AK. This will also require development of AK baselines and waste profiles for those wastes to be shipped off-site to a treatment, storage, and disposal facility.

2.10.3 Equipment Work Needs

- AK support.

2.11 Prohibited Item Removal/Liquid Remediation

The AMWTP currently has a significant inventory of containers awaiting processing in the SCW area of the AMWTF for removal of PI or for absorption of excess liquid.

2.11.1 Inventory Evaluation

The retrieved containers awaiting SCW processing (i.e., debris) were rejected from the AMWTF for the following reasons:

- Presence of mercury
- Impenetrable objects
- Pressurized containers
- Containerized liquids
- CI issues

Advanced Mixed Waste Treatment Facility
AMWTP Challenging Waste Forms and Disposition

- Sealed containers >4 liters
- Excess liquids
- Polychlorinated biphenyl (PCB) contamination

In addition some containers of homogenous solid waste have the following issues:

- Accessible liquids
- Sealed containers > 4 liters
- CI issues
- Filter issues
- Pressurized containers.

2.11.1.1 Retrieved Inventory

Currently, 452 debris containers require SCW remediation. An additional 1,414 drums and one box contain homogeneous solids with the issues identified above.

2.11.1.2 Projected Inventory

About 50% of the total waste container inventory for the TSA-RE has been retrieved. Therefore, the projected number of containers that will require PI removal is the same as the number of containers identified to date.

2.11.2 Disposition Approach

These containers will require either treatment or handling in the SCW glovebox.

Treatments:

- Addition of liquid absorbent,
- Inaccessible liquid/repackaging,
- Removal of >4 liter inner containers

Special Case Waste:

- Removal of mercury
- Impenetrable objects

Advanced Mixed Waste Treatment Facility
AMWTP Challenging Waste Forms and Disposition

- Pressurized containers

2.11.3 Equipment/ Work Needs

- Glovebox to remove PI
- Ability to puncture pressurized containers

2.12 Entrained Liquids within Homogeneous Solids

The AMWTP has sludge waste that has liquid that is not readily accessible. That is, the liquid is not on the top, but is entrained within the sludge. This makes processing more challenging.

2.12.1 Inventory Evaluation

The AMWTP has both organic and inorganic solids that have liquids entrained within the sludge.

Organic Homogeneous Solids

The AMWTP organic set-ups waste stream is contaminated with PCBs. PCB wastes are regulated under the Toxic Substance Control Act (TSCA). WIPP is prohibited from receiving TSCA-regulated wastes containing liquids. Specifically, there can be no residual liquids in TSCA-regulated waste containers. Radiographic examination of containers of IDC RF-003 (organic set-ups) has found that about 60% contain entrained liquids. Essentially all of the RF-003 containers have liquids that are entrained. TSCA-regulated liquid must be addressed before disposal. The AMWTP has been granted an Risk-Based Disposal Approval (RBDA) by the Environmental Protection Agency to treat containers of TSCA-regulated liquid by absorbing the liquid before sending the container to WIPP. The challenge to treating liquids in some of the RF-003 containers is that the liquid is located along the sides or bottom, between the bagging and liner, or entrained within the sludge.

Inorganic Homogeneous Solids

The inorganic solid stream also contains entrained liquids

2.12.1.1 Retrieved Inventory

Organic Homogeneous Solids

To date, 2,581 containers of organic homogenous solids have been identified with entrained liquids.

Advanced Mixed Waste Treatment Facility
AMWTP Challenging Waste Forms and Disposition

Inorganic Homogenous Solids

To date, 231 containers of inorganic homogenous solids have been identified with entrained liquids.

2.12.1.2 Projected Inventory

Organic Homogenous Solids

Table 16 identifies the number of organic homogeneous containers that have been identified with liquids through the Central Characterization Project (CCP) fast-scan RTR or an AMWTP RTR. This percentage was used to project the number of containers with entrained liquids.

Table 16. Organic waste with liquids.

Containers X-rayed by AMWTP or CCP	Containers Identified With Liquids	Containers Not Yet X-rayed	Estimated Containers With Liquids Not Yet X-rayed	Total Number of Containers With Liquids
4,775	2,581	5,010	2,805	5,385

Inorganic Homogeneous Solids

Since about half of the inventory has been processed, the remaining number of containers with entrained liquids is expected to be approximately equal to the number identified to date, or 231 additional containers.

2.12.2 Disposition Approaches

- Organic homogenous waste drums containing entrained liquids – the RBDA allows the use of a drum vibrator to bring the liquid to the surface for subsequent manual absorption. Vibration takes advantage of the potential thixotropic properties of the sludge. Once the liquids are on top they can be readily absorbed.
- Drums with liquid volumes too great to treat in the drum – liquids must first be decanted or aspirated from the container. The drum will then be treated for entrained liquids, through vibration and absorption.
- Drums with liquids located outside the waste's plastic packaging – piercing of the container and/or polyethylene rigid liner near the identified liquids will be needed to access the liquids for treatment.

2.12.3 Equipment/Work Needs

- Location to open a drum.

Advanced Mixed Waste Treatment Facility
AMWTP Challenging Waste Forms and Disposition

- Equipment to pump or decant liquids from a drum.
- Equipment to puncture a drum, followed by draining or tipping of the container to support draining of the liquids.
- Methods to inject absorbent near the bottom of a drum.

2.13 Containerized Liquids Within Homogeneous Solids

Through radiographic examination, both AMWTP and CCP have identified drums with inner containers (e.g., polyethylene bottles) with liquids in them. The WIPP WAC requires that waste contain as little residual liquid as is reasonably achievable by pouring, pumping, and/or aspirating, and internal containers shall contain less than 1 inch (2.5 cm) of liquid in the bottom of the container. Residual liquids containing PCBs are prohibited at WIPP; therefore, all liquid will have to be removed or absorbed. Sealed containers that are greater than 4 liters (nominal) are also prohibited and must be breached.

2.13.1 Inventory Evaluation

2.13.1.1 Retrieved Inventory

The retrieved inventory of drums with containerized liquids was identified through the AMWTP's nonconformance reporting system and CCP fast scan reject data. Table 17 summarizes the containers of organic waste that have been identified to date.

Table 17. Organic homogenous solid drums with containerized liquids summary.

Containers X-rayed by AMWTP or CCP	Containers Identified with Inner Containers	Number of Containers Not Yet X-rayed	Estimated Containers with Inner Containers Not Yet X-rayed	Total Containers with Inner Containers
4,775	73	5,010	81	154

In addition, sixty-seven containers of inorganic waste have been identified as containing sealed inner containers with liquids, for a total of 140 retrieved containers identified as having sealed inner containers of liquid.

2.13.1.2 Projected Inventory

It is projected that 81 containers of organic homogenous waste and 67 containers of inorganic waste will yet be retrieved and found to have inner containers of liquid.

2.13.2 Disposition Approaches

- Process for piercing and draining the inner container

Advanced Mixed Waste Treatment Facility
AMWTP Challenging Waste Forms and Disposition

- o Puncture must be made through outer steel drum, inner rigid liner, plastic bagging, the solid waste material, and the inner container.
- o Drained liquids must be treated and disposed.
- o Method must verify container puncture.
- Develop process for removing the inner container from the drum of homogeneous solids, which can have a “peanut butter” or wet, claylike consistency.
- Develop process for removing containers from homogeneous solids that are parfaited with concrete layers.

2.13.3 Equipment/Work Needs

- New process to remove liquids or inner container
- Liquids treatment

3.0 Cost Estimates

Three primary factors affect the overall cost of addressing these waste forms. Those three are capital costs, processing costs, and LDR treatment costs. Appendix A details these costs, plus additional costs for documentation and permitting. The overall total of these factors is approximately \$94 million.

3.1 Capital Costs

Capital costs, as detailed in Appendix A, are estimated at \$31.35 million. This estimate included the following assumptions.

Regarding the proposed new facilities (Options 1, 2, 3, and 5 of Appendix A) we assumed the following:

- Electrical power supply upgrades
- Main facility enclosure plus add on glovebox type specialty processing cells.
- Remote size reduction equipment
- Remote handling equipment and associated tooling
- Material handling systems
- HVAC systems

Advanced Mixed Waste Treatment Facility
AMWTP Challenging Waste Forms and Disposition

- Airlocks.

For the proposed upgrade of drum line cell upgrade (Option 4 in Appendix A) we assumed the following:

- Specialty remote size reduction equipment
- Remote handling equipment and associated tooling
- Material handling systems
- Waste container airlocks.

3.2 Processing Throughputs and Cost

For each of the waste forms, the spreadsheet given in Appendix A outlines the estimated processing throughputs. These throughputs were determined based on professional judgment and the experience of running the AMWTP. The cost associated with the running of each facility is also given in Appendix A. Processing costs were estimated at approximately \$32.5 million.

3.3 LDR Treatment Costs

The LDR treatment costs are estimated at \$28.3 million. These costs were derived from vendor supplied cost estimates and the anticipated treatment technology, e.g., macro-encapsulation or stabilization.

4.0 Summary

After careful evaluation of the challenging waste types and volumes discussed in this report, dispositioning the waste to offsite repositories can be accomplished by the end of FY 2014. To accomplish this, significant hurdles will need to be overcome, such as constructing new facilities, permitting those new facilities, and updating necessary safety basis documents. To support these goals, AMWTP will need to coordinate closely with DOE-ID and other agencies.
